Mr. Geo. Paul said he could not help thinking that the Society was fulfilling one of its best functions in endeavouring to improve forestry. The question of leaf-canopy was a novelty to him, and seemed to carry great weight with it. The only statement on which he differed from the writer of the paper was that which said that we ought to confine ourselves to native trees because in certain parts of England there might be climatic risks. He thought the papers they had heard that day were of such practical value that all the Fellows of the Society would be glad to read them. He would therefore propose a hearty vote of thanks on behalf of the members of that Society to the writers.

Mr. Geo. Bunyard seconded the motion. He said he would not trouble them on that occasion with the way in which they in Kent managed their woods, as he proposed to write a short history, to be published at the end of these papers in the Society's *Journal*, because their practice differed entirely from the suggestions made that day. To a very large extent the woodlands of Kent owed their very existence to the value they gave to an estate for sporting purposes. He would not go so far as to say he was against all kinds of sport; but it was a source of grief to him to see the way in which these trees were eaten up by rabbits. There was another point which struck him as a Kentish man. They very seldom planted trees for timber purposes. The greatest result was often to be obtained where trees were planted as underwood, and cut down in periodical cycles of from ten to fourteen years. He had known Chestnut wood to fetch £80 an acre. He could remember the time when Hops were poled with British poles; but then came the Norwegian Fir, and now the Hops were strung on string suspended from end supports.

Sir Alexander Arbuthnot, in responding to a vote of thanks to the Chairmen of the two meetings, read a telegram conveying greetings from their Secretary, the Rev. W. Wilks, who is progressing favourably after the severe operation which he has undergone. He thought it was really a matter which our statesmen and political leaders ought to consider, whether they ought not to do something to applying capital to the renewal and increase of our forests.

The Conference then terminated.

New Invention.

A NEW SHOW CARD.

The article known as the "Strong Strut Back" Show-card certainly deserves the adjectives with which the patentees describe it. It is composed of an oblong piece of exceedingly stout card, which can be hung by the ring at the back of it, or made to stand at any angle by means of the wide strut, which still further increases its power and adaptiveness. The whole of the back-strut, support, and suspension ring, are ingeniously stamped out of one piece of card, while the front is intended to bear advertisements—as for instance if the "Strut Back" were used as a name-card at horticultural exhibitions—or small articles, such as pencils, labels, or knives could be displayed upon it. For simplicity, durability, and appropriateness this show card has much to recommend it. It is sent out by Messrs. Strong & Co., of 8, Leonard Street, E.C.

CONCERNING ROOT SUCKERS OF STONE FRUITS, &c.

We have plenty of experience of the troublesome suckers which spring direct from the roots of the Plum, Cherry, and Damson, whether these be used as stocks for the ennobled varieties of their genus, or are themselves the fruit-bearers. The outgrowths lessen the vitality and growth of the tree, and if not pulled up, they cause its early death.

The general belief is, that a tree producing suckers is itself the product of a sucker; but, as a fact, it is the deep cultivation of the soil over the roots by a spade, fork, or hoe that is the cause of their appearance. As is well known, stone fruits must not be so deeply planted as Apples, Pears, and the like, or they will not succeed and bear large crops. By shallow planting, the roots are easily injured by the spade or hoe, and wherever an injury is made, there comes first a swelling, and later an outgrowth. It is, therefore, advisable to hoe or dig the land over the roots very lightly.

Manure-water for Winter Green Crops.

At this season, as well as earlier, the application of liquid manure during rainy weather works wonders on growth in Cabbages, Savoys, Coleworts, &c.

Tomatos.

To preserve Tomatos till late in the autumn, secure the fruits by their stalks to straw-bands like ropes of Onions, and hang them in a cool dry room. Half-ripe fruits should be wrapped in or placed under cotton-wool, and kept in a warm room. *Obstbau Vereins' Organ for Steyermark, September*, 1894.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.		Temperature. Accumulated. Above (+) or below (—) the Mean for the week ending September 22.	Above 42°, for the Week.	Below 42°, for the Week. The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N. 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending September 22, is furnished from the Meteorological Office:—

"The *weather* continued dry over the United Kingdom as a whole, but some rain was experienced over the more southern and south-western districts, mostly towards the end of the week. The sky was, however, extremely cloudy generally, the only exceptions being over the Channel Islands and some of the northern Scotch stations. Some thunder and lightning occurred in the south-west during the night of Thursday.

"The *temperature* either just equalled the normal, or was 1° above it. The highest of the maxima were registered on the 18th or 19th, when they ranged from 72° in 'England, E.,' 71° in 'England, S.W.,' and 70° in 'Ireland, N.,' to 63° in 'England, N.E.' The lowest of the minima were recorded on somewhat irregular dates, and varied from 34° in 'Scotland, E.,' and 36° in 'Scotland, N. and Ireland, N.,' to 43° in the 'Midland Counties and England, N.W.,' to 49° in the 'Channel Islands.'

"The *rainfall* was again less than the mean in all districts, especially in the northern parts of the Kingdom, where the fall was extremely slight.

"The *bright sunshine* exceeded the mean in the 'Channel Islands,' but was deficient elsewhere. The percentage of the possible duration ranged from 4 to 20 over 'England,' from 15 to 17 in 'Ireland,' and from 16 to 26 in 'Scotland,' while in the 'Channel Islands' the percentage was as high as 41. The lowest percentage of the possible duration recorded at any individual station was that at 'Oxford,' where it was only 1 per cent., in 'London' and at several stations in the 'Midland Counties' there was only 3 per cent., at 'Edinburgh' 5 per cent., and at 'Dublin' 8 per cent."

MARKETS.

COVENT GARDEN, September 27.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOS.

Trade slow except for best samples. Prices:—Snowdrops and Main Crops, 80s. to 90s.; Hebrons, 70s.; Giants, 50s. to 60s.; Blacklands, 50s. per ton.

SEEDS.

LONDON: *September* 26.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that the sale for Trifolium now naturally diminishes. Fine new English winter Tares are now obtainable at very tempting figures. Sowing Rye also continues exceedingly cheap. Samples of new white Mustard have now begun to come forward. Rapeseed is steady. The new French Buckwheat just landed meets with favour. Canary seed is featureless. Hemp seed firm. Linseed quiet. Haricots improving. Peas unchanged.

FRUITS AND VEGETABLES.

BOROUGH AND SPITALFIELDS: *Sept.* 25.—Quotations:—Cabbages, 1s. 6d. to 3s. per tally; Turnips, 1s. to 2s. 3d. Carrots, 1s. to 2s. 3d.; Parsley, 9d. to 1s. 6d. per dozen bunches; Beans, Scarlet, 1s. to 1s. 6d. per bushel; Horseradish, 1s. to 1s. 6d. per bundle; Onions, foreign, 3s. to 3s. 6d. per bag; do., English, 4s. to 5s. per cwt.; Apples, 1s. to 1s. 6d. per bushel; Pears, 9d. to 2s. 6d.; Plums, 1s. to 2s. 3d. per half bushel.

STRATFORD: *Sept.* 25.—The supply to this market during the past week has been excellent, and with a large attendance of buyers a brisk trade was done at the undermentioned prices:—Cabbages, 1s. 9d. to 4s. per tally; Collards, 1s. 9d. to 3s. per tally; Cauliflowers, 1s. to 2s. 6d. per dozen; do., 4s. to 10s. per tally; Turnips, 1s. 6d. to 2s. per doz. bunches; Carrots, household, 40s. to 45s. per ton; do., cattle feeding, 25s. to 28s. do.; Mangolds, 16s. to 21s. per ton; Swedes, 16s. to 18s. do.; Onions, English, 80s. to 90s. per ton; do., Belgian, 2s. 6d. to 3s. 6d. per bag; do., Oporto, 5s. to 6s. 6d. per case; Apples, English, 2s. to 7s. per bushel; Pears, 2s. to 4s. per barrel; Watercress, 6d. per dozen; Beans, 1s. 6d. to 1s. 9d. per sack; Cucumbers, frame, 1s. to 3s. per dozen; do., field, 4d. to 8d. do.; Celery, 9d. to 1s. 2d. per roll; Horseradish, 1s. to 1s. 3d. per bundle.

FARRINGDON: *Sept.* 27.—Quotations: Apples, 3s. to 6s. per bushel; Pears, 1s. 6d. to 4s. do.; Plums, 3s. per half-bushel; Mushrooms, 4s. per half-bushel; Blackberries, 5s. per half-bushel; Tomatos, English, 3s. per 12 lb.; Walnuts, bag, 24s. of 75 kilos.; Cob-nuts, 3½d. per lb.; Cucumbers, 1s. 6d. to 1s. 9d. per dozen; Grapes, English, 1s. per lb.; do., Almeira, 3d. do.; Onions, 4s. to 4s. 6d. per bag; do., picklers, 5s. to 6s. do.; Carrots, 50s. per ton; Turnips, 45s. do.

POTATOS.

BOROUGH AND SPITALFIELDS: *Sept.* 25.—Quotations ranged from 45s. to 80s. per ton.

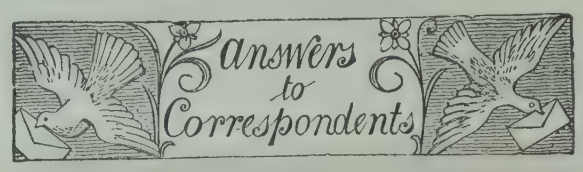
STRATFORD: *Sept.* 25.—Quotations:—Main Crop Kidneys, 60s. to 70s.; Bruces, 55s. to 70s.; Imperators, 50s. to 75s.; Dark-soil Magnums, 45s. to 50s. per ton.

FARRINGDON: *Sept.* 27.—Quotations:—White Hebrons, 70s. to 80s.; Sutton's Abundance, 70s. to 80s.; Maincrop, 70s. to 80s.; Bruces, 60s. to 70s.; Magnums, 55s. to 65s. per ton.

LONDON AVERAGES: *Sept.* 26.—Hebrons, 6s. to 80s.; Magnums, 50s. to 65s.; kidneys, 50s. to 70s.; Snowdrops, 70s. to 85s.; Black-lands, 45s. to 55s.; rounds, 50s. per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 75s. to 135s.; do., inferior, 45s. to 120s.; hay, best, 10s. to 130s.; do., specially picked, 138s.; do., inferior, 60s. to 100s.; do., new, 70s. to 90s.; Mixture, 90s. to 120s.; and Straw, 30s. to 42s. per load.



CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending September 22, and for the corresponding period last year:—1894: Wheat, 19s. 8d.; Barley, 23s. 5d.; Oats, 15s. 2d. 1893: Wheat, 26s. 9d.; Barley, 27s. 10d.; Oats, 17s. 9d.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

IRRIGATION IN TROPICAL COUNTRIES.—Will some reader of these pages kindly inform "West Indian" the titles of some standard works on the above subject?

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** PLANTS, FRUITS, ETC., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

BOOKS: *T. S.* A manual on *Violet Culture* by Mr. Heath, is published by Mr. Birket, Kendal.—*A. A. M. My Gardener*, by H. W. Ward, price 2s. 9d., published by Messrs. Eyre & Spottiswoode, East Harding Street, London, E.C.—*W. A. M. Hardy Flowers*, by W. Robinson, is a more portable volume than the *Flower Garden*, by the same author. Published by Macmillan & Co., Bedford Street, Covent Garden, W.C.—*Les Cultures sur le littoral de la Mediterranée*, by Dr. E. Sauvaigo, published by MM. J. B. Ballière et Fils, 19, Rue Hautefeuille, Paris. A handy and useful book for the pocket. *The Gentlewoman's Book of Gardening*, by Mrs. Chamberlain and Mrs. Douglas. Published by Henry & Co., Bouverie Street, London, E.C.

CINERARIAS AND CALCEOLARIAS: *X. Y. Z.* There must have been some point in their cultivation omitted or not understood, but what that is we cannot say. Have you been using manures, artificial or other?

DISQUALIFICATION AT FLOWER SHOW: *Excelsior.* Supposing the facts to be as you state them:—1. You were quite justified in disqualifying the exhibitor; 2. The exhibitor is certainly bound by the rules; 3. We do not know, but we are of opinion that the County Court Judge would have no jurisdiction, provided the rules were fairly acted on; 4. Is more than we can answer, in view of the glorious uncertainty of the law.

FUNGUS: *J. P.* Stink Horn (Phallus impudicus). Gas-lime may destroy the spawn if heavily applied to the soil on which it grows; but it is a very erratic species, springing up in all sorts of places on poor soils.

GRAFTING ROSES: *C. W. F.* It is not the usual time to graft Roses, but we see no reason why grafts should not "take" on roots, if these be potted, or the mass of mould and roots secured by wrapping it round with moss, and tying this fast with matting. They might be stood close together over bottom-heat of 70°; and when new growth is apparent, or even before, grafted with short scions of the Roses it is desired to increase. They would have to be kept rather close till taken. The difficulty would be to keep them going after they had "taken," as that would be at the beginning of the winter, when any growth that would be made would be weak from want of light and ventilation. January is a much better month, potting the stocks in November, keeping them in a cool house, and not exciting them till about fourteen days before grafting. Such stocks may be mere roots, or dwarfs, half standards, and standards; the first two either Briars, Manettis, and La Grifferaie; and the last two Briars only. All stocks require soil about them to be kept moist. Grafting-wax, Homme le Fort, or other similar, should be used; wax preventing the ingress of moisture at the point of union better than clay.

HORSE-MUSHROOM: *J. P.* Agaricus arvensis.

HOUSE 100 BY 12 FEET, SPAN-ROOFED: *Gaucho* Either Cucumbers or Tomatos would give good returns, if you plant out at once strong plants, but the crops would not turn in at an early date. Tomatos for winter should at this season be of good size, with fruits already set in some quantity.

HYDRANGEAS: *Enquirer.*—These may be struck in bottom-heat of 85°, in a frame or propagating-case, from strong young shoots, with a heel of old wood. The heads of bloom are generally larger than from plants struck in the early spring from shoots taken from plants forced into growth. Strike them singly in thumbs or small 60's, and keep them after rooting gently moving, shifting them once or twice. Hydrangeas must be root-bound to cause them to throw up flowers readily. Spring-struck plants are grown in greenhouse pits, without much shade, throughout the months of May, June, and July, and then stood out in the open air in full sunshine till the end of August. These plants will force readily after they have lost their foliage, and rested for a month or two, with but little water afforded at the root during that period.

LAW RELATING TO MARKET GARDENERS' BUILDINGS: *J. Jonsin.* We think that you cannot do better than obtain copies of the Acts relating to the matter. There have been alterations made recently, but we cannot say precisely of what these consist. Messrs. Eyre & Spottiswoode, Queen's Printers, East Harding Street, E.C., supply copies at small cost.

MEALY-BUG ON VINES: *A. A. M.* It is difficult of eradication if it has been allowed to increase much. When the leaves have fallen, sweep up and burn them; then proceed to strip the rods of the loose rough bark, and only this should be removed, being careful to clear out the angles at the base of the fruit-spurs. Having done this, make a mixture of dry clay and gas-tar, about one pint of the latter to a bucketful of the former, kneading it well together, and afterwards adding water, till it is of the consistency of paint, and with this paint every part of the Vines, especially paying attention to likely hiding-places. Throw the vinery open to the frost if convenient to do so; wash the woodwork with water, petroleum, and soft-soap, 1 pint of the oil to 3 gallons of water, not using more soap than will assist the incorporation of the oil, or much of the paint will be removed from the wood; lime-wash the walls, adding some salt and sulphur to the wash. See that the brickwork is properly pointed; and finally, remove carefully with shovels the upper-crust of the borders to a depth of 3 inches, and replace with fresh soil. It will be necessary to examine the Vines during the summer, touching any bugs that may be found with a camel-hair pencil dipped in methylated spirits. A band covered with moist gas-tar may be put round the Vine stems near the ground level; but the tar must not touch the bark, or the Vines will die.

NAMES OF FRUITS: *G. S.* 1, Manks' Codlin; 2 and 3, most probably Keswick Codlin; 4, Jargonelle; 5, Williams' Bon Chrétien.—*W. Newton.* 1, Cox's Orange Pippin; 2, Cox's Pomona; 3, Margil; 4, Alfriston; 5, Warner's King; 6, Sturmer.—*T. E.* Pear Souvenir du Congrès.—*A. A.* 1 and 3, Marie Louise; 2, Duchesse d'Angoulême; 4, Williams' Bon Chrétien; 6, Easter Beurré Pear; 5 and the Peach were too much damaged.—*Dartnall & Co.* 92, Dutch Codlin; 87, Emperor Alexender; 147, Frogmore Prolific; 76, Lane's Prince Albert; 152, Baxter's Pearmain × Waltham Abbey Seedling.—*G. S.* Apple Col. Vaughan; 4, Pears, Josephine de Malines; the others such small miserable scrubs that we cannot recognize. *Amy R.* Pear, Fondante d'Automne.—*G. W. F.* Pears, 1, Beurré Clairgeau; 2, Bishop's Thumb; 3, Beurré Bachelier; 4, General Todtleben; 5, Beurré d'Amanlis; 6, Doyenné du Comice; 7, Duchesse d'Angoulême; 9, Fondante d'Automne; 10, Beurré Bosc; 11, Triomphe de Jodoigne; 12, Williams' Bon Chrétien; 13, Barrone de Mello; 14, Hampden's Bergamot; 15, Hessle; 16, Beurré Hardy; 17 Beurré Sterckmans. Six is the largest number you should send.—*A. H.* Apple Dutch Codlin.—*Oakfield.* 1, not recognised; 2, New Hawthornden; 3, Cox's Pomona.—*John Kingland.* Pears: 1, Van Mon's Leon Leclerc; Doyenné Boussoch; 3, Beurré Rance; 4, B. Diel, 5, B. de Capiaumont; 6, Marie Louise.

NAMES OF PLANTS: *L. C., Rugby.* Staphylea trifoliata. S. pinnata is smaller in all its parts, also seeds.—*D. & D.* 1 and 2, we are quite unable to name single leaves, such as you send.—*A. J. P.* Melilotus officinalis (common Melilot).—*F. C. P.* 1, Viburnum Lantana; 2, Berberis vulgaris; 3, Corydalis lutea.—*J. K.* Helianthus rigidus and Centaurea moschata.—*W. H. Y.* Solidago Virgaaurea, Golden Rod.—*W. J. W.* Polygonum persicaria.—*X. Y. Z.* 1, an Escallonia, send flowers; 2, Cephalotaxus drupacea; 3, Thuia orientalis var. Sieboldi; 4, Retinospora plumosa, variegated, a form of Cupressus pisifera; 5, a variety of Cupressus Lawsoniana; 6, Cupressus Nootkatensis, *alias* Thuiopsis borealis.—*W. D.* 1, Phygelius capensis; 2, Aspidium Filix-mas.—*G. S.* sends 2*s.* 6*d.* for the Gardeners' Orphan Fund, for which many thanks; 1, the cut-leaved Alder, Alnus glutinosa; 2 the Hornbeam, Carpinus betulus; 3, Spiræa Fortunei; 4, Salix caprea, probably; 5, Populus alba.—*A. W. M.* Should address such communications to the Editor, not to the Publisher. 1, Calamintha acinos; 2, Pedicularis sylvatica; 3, Euphrasia officinalis; 4, Samolus Valerandi; 5, Bartsia odontites; 6, Echium vulgare.—*W. P.* Echinops ruthenicus, Cardiospermum Halicacabum.—*B. C., Liverpool.* Yours is a very brightly-coloured form of Vallota purpurea major. The specimen of Lapageria rosea is producing its flowers in an unusual manner, at the ends of the shoots. We do not remember having seen a similar specimen.—*P. W., Magdeburg.* Stanhopea saccata.—*C. B.* The plant is known to us as Pleroma macranthum (syn., Lasiandra).—*W. P.* A very fine form of Cattleya maxima.—*T. M.* 1, Lygodium scandens; 2, Polypodium subauriculatum; 3, Trachelium cœruleum; 4, Leycesteria formosa; 5, Asplenium bulbiferum; 6, Pteris serrulata.—*Label Missing.* ? *A. W. M.* Polygonum orientale.—*J. H. B.* 1 and 2, both species of Verbascum, which we cannot name from such material; 3, Melilotus officinalis; 4, Hibiscus Trionum; 5, Sedum Telephium; 6, Euphorbia Cyparissias.—*Burghley.* Cratægus tanacetifolia (Tansy-leaved Thorn).

PEARS ATTACKED BY FUNGUS: *A. Reid.* A fungus (Fusicladium dendriticum, Fckl.) is the cause of the disease. This fungus first appears on the leaves, and afterwards, in damp seasons, passes on to the fruit. The trees should be sprayed when the fungus first shows as minute, velvety, olive patches on the leaves, or, as a preventive, before the fungus appears. Bordeaux Mixture has been proved effective. *G. H, Massee.*

TOMATO: *Colchester.* The insect attacking your Tomatos is Aleyrodes Vaporarium. Fumigation or the use of Richards' XL Liquid Insecticide will prove serviceable. We do not, however, think the insect does much mischief.

ARMITAGE'S INVINCIBLE MANURE.
STIMULATING! ECONOMICAL! LASTING!
The Best Fertilising Compound.
Report of Analysis made by Alfred Sibson, F.C.S., the Analytical Laboratory, 23, St. Mary Axe, London, E.C.:—
"This is a HIGH-CLASS CHEMICAL MANURE, especially suited for Garden use. It contains about 6½ per cent. of Ammonia derived from Organic matter, Ammonia Compounds, &c., and with a good proportion of Phosphates (both soluble and insoluble), Potash, &c. As its physical properties or 'condition' is also well attended to, it will, in my opinion, be found a VALUABLE MANURE for GENERAL HORTICULTURAL PURPOSES. (Signed) ALFRED SIBSON, F.C.S."
PRICES.—In Tins: 3d., 6d., and 1s. each; or Free by Post for 6d., 10½d., and 1s. 6d. In Bags: 7 lb., 1s. 6d.; 14 lb., 2s. 6d.; 28 lb., 4s.; 56 lb., 7s. 6d.; 112 lb., 14s. 6d.
All Orders for One Cwt. and upwards delivered Free to any Railway Station in the Kingdom.

MURRAY'S "ELECTRIC" MILDEW and INSECT DESTROYER, a purely Vegetable preparation, harmless to plant life, a perfect cure of Mildew and all Insect Pests.
ALEXANDER CROSS AND SONS, 79, Mark Lane, London.

C. BEESON'S MANURE.—Composed of Blood and Bone. The Best Fertiliser for all purposes. Sold in tins, 1s., 2s. 6d., and 5s. 6d.; also in air-tight bags, ¼ cwt., 6s.; 1 cwt., 10s. Full directions for use sent with each tin and bag. 1 cwt. and above sent carriage paid, cash with order. C. BEESON, Bone Mills, St. Neot's, Hunts.
"12, Knowle Road, Brixton, London,
"I have tried this fertiliser on various garden crops, and I am able to say that it is an excellent Manure for Vegetables, Flowers, Vines, and Fruit Trees.
"A. B. GRIFFITHS, Ph.D., F.R.S.E., F.C.S."

GISHURST COMPOUND, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water; 4 to 16 ounces as a winter dressing for Vines and Orchard house trees, in lather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.
GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

TO FLORISTS.—Wanted by a young Man (age 21), situation as SHOPMAN. Five years' experience in a London Shop. Used to Covent Garden and good make up.—Apply B. B., 14, Stamford Terrace, Stamford Hill, N.

FOREIGN COMPETITION is often declared to be the cause of much of the suffering in this country, and we are told that the number of foreigners in England make it very difficult for the Englishman to get a living. However this may be, it is certainly true that the presence of foreign matter in the blood endangers the health of the whole system. To purify the blood and to correct disorders of the liver and stomach, the only certain, safe, and agreeable medicine is Holloway's Pills. If you suffer from gout, rheumatism, or lumbago, scalds, burns, or similar evils, you must use with the least possible delay Holloway's Ointment. For over half-a-century these famous remedies have been the faithful friend of man.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S

PATENT SELF-ACTING HYDRAULIC RAMS,

FOR RAISING WATER FOR THE SUPPLY OF TOWNS, VILLAGES, IRRIGATION, RAILWAY STATIONS, MANSIONS, FOUNTAINS, FARMS, ETC.

No cost for Motive Power, which is obtained from a Stream of Water passing through the Ram. No Oiling or Packing required. Made in sizes to raise from **300 to 300,000 gallons per day.** Will force to a height of 800 feet.

Fig. A.
This Ram raises a portion of the same water that works it.

This View represents a Ram worked by impure river water, whilst pumping pure water from a well or spring and forcing it to a small reservoir on the hill, at an elevation of 295 feet and a distance of one mile, from which reservoir the water is gravitated for fire-extinguishing and general requirements of mansion, stables, farm, and village.

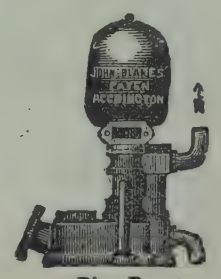

Fig. B.
This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

TESTIMONIALS.

From T. FERNYHOUGH, Esq., Agent to The Right Hon. LORD HINDLIP.

Bradley, Ashbourse, Derby, March 17, 1894.

DEAR SIR,—Referring to the two Patent "B" Rams you started six months ago for the Right Hon. Lord Hindlip, on the Alsop-en-le-Dale Estate, I am glad to congratulate you on the success of your attempt to raise the necessary supply of water under conditions so difficult, the height to raise the water being more than **63 times that of the working fall.** The Rams are worked by water from the River Dove with the small working **fall of 8 feet 3 inches,** and issuing from the rocky bank close by is a copious stream of pure spring-water, **8000** gallons per day of which the Rams force to a reservoir three-quarters of a mile distant, and at the extraordinary height of **532½** feet above the Rams. The water is then gravitated from the reservoir to the several farms and houses on the estate, giving an ample supply to each, and still leaving a good overflow at the reservoir.

I am glad to add that the Rams lift more water than you promised, and seem to work with great ease and smoothness, notwithstanding the great elevation they force to.

Yours faithfully, T. FERNYHOUGH.

From T. DYNE STEEL, Esq., M.Inst.C.E., Past President South Wales Inst. of Engineers, Bank Chambers, Newport, Mon., April 24, 1891.

USK WATERWORKS.

DEAR SIR,—In September of last year I applied to you for a Hydraulic Ram for the purposes of the Usk Waterworks, to be capable of raising 27,000 gallons per day, a height of 127 feet, with a working fall of driving water of 27 feet, and on your guaranteeing that performance I gave you an order for the Ram. The machine you supplied has now been put to work, and I have much satisfaction in saying that it far and away exceeds in its performance my most sanguine expectations, and possibly yours also. I have just completed a series of exhaustive tests with the following results: Working fall of driving water, 30 feet; vertical height raised, 127 feet; length of rising main, 850 feet, from Ram to outflow; length of supply pipe, 200 feet; gallons per hour raised, 1612; driving water used per hour, 8186 gallons, showing the remarkable and gratifying result of **83 per cent. of efficiency.** The tests were carefully made and repeated, the water measured, and levels properly taken. Several trials were made, and I shall be glad to give any engineer interested in the subject, facilities for repeating the tests at the spot. I may here state that for the rising main I used a large diameter of pipe in order to reduce friction, with excellent effect. Yours faithfully, T. DYNE STEEL.

From the Hon. The Earl of HARROWBY, 44, Grosvenor Square, London, February 21, 1893.

SIR,—I have pleasure in stating that the two Hydraulic Rams, which you supplied and fixed for me last autumn, at Sandon, have proved so far most successful, and that the work gives every promise of durability, while the economy, compared with the former much smaller and intermittent supply by steam-pump, will be considerable.

With a fall of about 14 feet from a previously existing mill-pool, the Rams supply reservoirs 168 feet above the brook whence the water is forced, through pipes 1½ miles in length. They sent up, as long as I required it, about 41,000 gallons per day. I now generally work the two Rams alternately (for a fortnight or so each), but can at any time work the two together, if the full supply of 41,000 gallons should be needed.

The business of this somewhat complicated water-supply was conducted by you with singular promptness and punctuality; and no local difficulties arose in the execution of the work, owing to the excellent and efficient men whom you sent from your works at Accrington.

I am, Sir, your very obedient servant, HARROWBY.

From CHARLES HART, Esq., A.M.I.C.E., 3, Avenue Road, Leamington, March 13, 1893.

BRIXWORTH UNION RURAL SANITARY AUTHORITY, EAST HADDON WATER SUPPLY.

DEAR SIR,—Since the opening of these works in May, 1891, the two double-acting "B" Rams supplied and fixed by you have done their work with a minimum of attention, uninterruptedly and satisfactorily. Pure spring water obtained from a gathering-ground on the side of a hill is carried along iron pipes a distance of 548 yards, down to a cistern fixed in the Ram-house. From this cistern it flows to the Rams, which are driven by impure water—drawn from an adjacent brook, with an available fall of 12 feet—and thence by them forced along an ascending delivery pipe, a distance of 1520 yards, to an iron reservoir, at an elevation of 204 feet. From this reservoir mains are laid which supply the hall with its stabling, the rectory, six farm-houses, two dairies, and twenty-four wall-fountains for the villagers' use.

The average daily consumption exceeds 4000 gallons, which one Ram easily delivers, thus exceeding your guaranteed quantity by more than 1000 gallons per Ram per 24 hours. Generally the two Rams are regulated to divide the work between them, but occasionally it devolves upon one only.

If more widely known, this means of supplying villages and small towns with a limited quantity of spring water, forced to a suitable elevation by means of your Rams driven by impure water, would most certainly be more generally adopted.

Yours faithfully, CHARLES HART.

From C. PAGE WOOD, Esq., Wakes Hall, Wakes Colne, Essex, January 11, 1889.

SIR,—In reply to your inquiry, the Hydraulic Ram you put down for me in 1884 has cost me only 6*d.* in repairs (for a new stud my blacksmith made); the second Ram you put down to supply an off-hand farm has been running three years, and has cost not a penny for repairs; the third and largest Ram you put down two months ago, which is for the supply of water to my neighbours, is running satisfactorily. All three Rams throw up more water than you guaranteed. From inquiries I have made from friends who have Rams of other makers, I am convinced of the superiority of yours, and my third order is a proof of my good opinion. My abundant water-supply is the greatest possible comfort to me. Yours faithfully, C. PAGE WOOD.

From Sir S. M. MARYON WILSON, Bart., London, Nov. 17, 1891.

SIR,—I have much pleasure in stating that the two "A" Rams you supplied and fixed for me at Searles, on my Sussex estate, have proved a great success, especially when the small supply of driving water is considered, as with a supply of 7 gallons per minute only, they have daily thrown 3000 gallons to a height of 96 feet, and through a service of pipes over a mile in length; and testing them recently (with plenty of driving power) found they lifted 7000 gallons per day.

The economy effected by their use is considerable, as they have entirely superseded a steam pump.

S. M. MARYON WILSON

From MATTHIAS SMITH, Esq., Hill Top Hall, Pannal, near Leeds, January 14, 1889.

DEAR SIR,—I have great pleasure in bearing testimony to the marvellous efficiency of the Ram you fixed here in January, 1888. It is worked by spring water of irregular volume, the dry weather flow being six pints per minute, with which quantity you promised to work the Ram, forcing through 330 yards of delivery pipe to an elevation of fully 144 feet, but out of 5¾ pints per minute, 166 gallons per day are sent up, and out of 2 gallons per minute now flowing through the Ram, 540 gallons per day are delivered at the same height. Considering the extremely small quantity of driving water, I certainly did not expect so grand a result. With every wish that you may get the reward you deserve,

I am, dear Sir, yours faithfully, MATTHIAS SMITH.

JOHN BLAKE, RAM WORKS, ACCRINGTON, LANCASHIRE.

HIGHLY IMPORTANT SALE

Of the Remaining Portion of the Famous

PICKERING LODGE COLLECTION

OF

ESTABLISHED ORCHIDS,

Together with the

GARDEN TOOLS, GREENHOUSE PLANTS, CARRIAGES,

and a portion of the

WELL-KNOWN CELLAR of CHOICE WINES

formed by the late George Hardy, Esq. The Orchids are reputed to be the Grandest Lot of Plants in the North of England, having won the Highest Honours at Manchester and other leading Shows.

By Order of the Executors, without the slightest Reserve.

MESSRS. PROTHEROE AND MORRIS, are favoured with instructions to SELL by AUCTION on the Premises, Pickering Lodge, Timperley, near Manchester, on TUESDAY, October 16 and following days, at half-past 12 o'Clock precisely each day, the Remaining Portion of this far-famed COLLECTION of ORCHIDS.

The whole of the plants are in the best possible health, and are remarkable alike for their size and the grandeur of the varieties. For upwards of twenty years the late Mr. Hardy was an enthusiastic buyer and a keen judge, and made a practice of discarding from his collection all varieties that did not reach the highest standard of excellence. In order that intending buyers may judge for themselves of the beauty of the varieties, an effort will be made as far as practicable to offer everything in flower.

Amongst the numerous items to be offered will be found the following:

Cypripedum cœnanthum superbum
" Statterianum
" Swinburnii
" Leeanum gigantum
" Lathomianum giganteum
" Io Grande
" Arthurianum
" insigne Studleyana
" " giganteum
" Godseffiana superbum
" insigne aureum
" Amesiana
" insigne Sanderæ
" javanico superbiens

55 English, American, and Foreign Press opinions.
Gardeners' Chronicle:—"It is commended as saving 100 to 200 per cent." The *Gardening World*:—"There is no question as to the utility." The *Horticultural Review*:—"Will effect a complete revolution." *Amateur Gardening*:—"Can honestly commend the style as eminently practical." The *Journal of Horticulture*:—"May be used for Vines, Tomatos, Chrysanthemums, Roses, Strawberries, and Fruit Trees generally."

ODONTOGLOSSUM CRISPUM ALEXANDRÆ.

BEST VARIETY.

GUILLERMO KALBREYER begs to offer the above well-known and justly-prized Orchid at the following prices, free on board of Royal Mail Company's steamers, at Savanilla or Cartagena:—**£40 per 1000 good and healthy pieces.**

G. K. also can supply:—

ODONTOGLOSSUM LUTEO-PURPUREUM,
" CUSPIDATUM PLATIGLOSSUM,
£36 per 1000.

CATTLEYA TRIANÆ, best variety, £7 per case.
" SCHRODERI ... £8 " "
Each case contains from 50 to 60 good strong pieces, and measures about 20 in. by 34 in.

The plants are packed with the greatest care and best method, but under no circumstances will G. K. hold himself responsible for the state of plants on their arrival in Europe. *Conditions:*—All Consignments are shipped entirely at Buyer's risk and expense from port of shipment. Plants ordered must be paid for on receipt of bill of lading to Messrs. ROESING BROTHERS AND CO., 10, Basinghall Street, London, E.C., who will then give orders for forwarding the consignment to the Purchaser.

The best time for dispatching Orchids from here, and to establish them with the best advantage in Europe, are the months—December to April.

EARLY ORDERS INVITED.

A considerable reduction will be made on orders of 1000 and more of each kind of Odontoglossum, and on four cases and more of Cattleya.

Address:—G. KALBREYER, La Flora, Bogota, Republica de Colombia.

FRUIT TREES! FRUIT TREES!! FRUIT TREES!!!

This is one of our GREATEST SPECIALTIES, the soil and situation of our Nurseries being particularly adapted for Fruit Growing, and we Cultivate IMMENSE QUANTITIES of all the BEST and CHOICEST kinds in each class, including the LATEST NOVELTIES, worthless and inferior sorts being carefully weeded out. The trees are in the finest possible condition, thoroughly clean and free from blight, of robust constitution, and furnished with an abundance of fibrous roots—an important point which purchasers of Fruit Trees should not overlook, as well-rooted trees will give greater satisfaction than trees twice the size, but with stunted roots. Each kind is worked on the stock on which it flourishes best, and great care is taken to have all true to name.

APPLES, PEARS, PLUMS, CHERRIES—Standards and Pyramids, well developed trees, 18*s*., 24*s*., 30*s*., 36*s*. and 42*s*. per dozen. Two-year old Feathered trees of Apples and Pears, splendid quality, 15*s*. per dozen. Dwarf and Horizontal-trained trees, for walls, espaliers, &c., 2*s*. 6*d*. to 5*s*. each. Orchard House Trees, Pyramids, in pots, 3*s*. 6*d*. and 5*s*. each.

We can also supply a splendid lot of Pyramid Apples, trees that have borne fruit two and three years, of the following well-known kinds:—Astrachan Red, Annie Elizabeth, Betty Geeson, Blenheim Orange, Cox's Pomona, Cellini, Duchess of Oldenburg, Domino, Devonshire Quarrenden, Ecklinville Seedling, Grenadier, Keswick Codlin, Lord Derby, Lord Grosvenor, Lady Elizabeth de Tabley, Loddington's Seedling or Stone Apple, Maltster, Northern Spy, New Northern Greening, Pott's Seedling, Plumbley Lass, Queen Caroline, Rose of Sharon, Ringer, Small's Admirable, and Old Hawthornden, all at 5*s*. each. Also a few extra-sized Pears at same price.

APRICOTS, PEACHES, NECTARINES—THE BEST VARIETIES. Dwarf-trained trees, 5*s*. and 7*s*. 6*d*. each. Half-Standard and Standard-trained trees, 7*s*. 6*d*. and 10*s*. 6*d*. each.

FIGS—A choice selection, fine bushes in pots, 2*s*. 6*d*., 3*s*. 6*d*., 5*s*., 7*s*. 6*d*. and 10*s*. 6*d*. each.

GRAPE VINES—All the leading varieties, strong, short-jointed, and well-ripened. Planting Canes, 3*s*. 6*d*. and 5*s*.; Fruiting, 7*s*. 6*d*., 10*s*. 6*d*. and 12*s*. 6*d*. each.

All the undernoted are for best quality, our selection only. Purchasers' selection as per Catalogue.

BLACKBERRIES, of sorts, plants in pots, 9*d*. each, 8*s*. per dozen. Ground plants, 6*d*. each, 4*s*. 6*d*. per dozen.
CURRANTS and **GOOSEBERRIES**, the leading kinds in the various colours, 3*s*. 6*d*. and 4*s*. 6*d*. per dozen; 25*s*. and 35*s*. per 100.
RASPBERRIES, finest sorts, 1*s*. 6*d*. and 2*s*. per dozen; 10*s*. and 12*s*. per 100.
STRAWBERRIES, complete collection of the newest and best varieties. Grand plants. Specially-prepared runners from ground, 3*s*. per 100. In small pots, 13*s*. 6*d*. per 100. In 5-inch pots, 4*s*. and 6*s* per dozen.
ASPARAGUS, extra strong, for forcing, 12*s*. 6*d*. and 15*s*. per 100.
SEAKALE, extra strong forcing crowns, 16*s*. per 100.
RHUBARB, the most esteemed kinds, 6*s*., 9*s*., 12*s*., and 18*s*. per dozen.

NEW CARNATIONS | PERPETUAL OR WINTER-BLOOMING VARIETIES.

Certificated by the Royal Horticultural Society, also at the Crystal Palace, Bath, Exeter, &c.

MISS MARY GODFREY.—Undoubtedly the finest white in existence. Blooms of good shape and good substance, 3 inches in diameter, of the purest white, freely produced, of robust habit, "non-bursting," and thoroughly perpetual.

REGINALD GODFREY.—Has the same good qualities as the preceding variety, but is of a rich salmon-pink. Three times the size of Miss Joliffe, richer in colour, much more robust, and will produce *five* times the quantity of blooms. 5/- each.

These varieties have caused a great sensation wherever exhibited.

NEW AND BEAUTIFUL HARDY SPIRÆA

SPIRÆA ANTHONY WATERER.

This is a sport from the well-known Spiræa bumalda, from which it differs only in colour, the flowers being a rich crimson, borne in large corymbs thickly on the plant.

It is a continuous bloomer, and is without doubt the most important addition to hardy flowering plants of many years.

FIRST-CLASS CERTIFICATE,
Royal Horticultural Society of London.

Nice plants, 7*s.* 6*d.* each, will be distributed in November next.

THE
Gardeners' Chronicle.
SATURDAY, OCTOBER 6, 1894.

THE BUITENZORG BOTANICAL GARDEN.

THE Botanical Gardens at Buitenzorg, in the Isle of Java, are now universally acknowledged to be among the finest and most extensive in the world. Buitenzorg is situated some forty miles inland in a direct line taken south from Batavia. The climate here is delightful, for the nights are cool, while the sun during the day does not hinder one from getting a certain amount of walking exercise.

Probably but few English botanists have been so fortunate as to have paid a visit to Java, and an account, therefore, of a very recent visit to the island, by a distinguished French scientist, must be of great interest. M. Albert Tissandier, one of the directors of *La Nature*, sends to a recent number of that journal an account of his visit to Buitenzorg, and from his paper we extract a few paragraphs. The English naturalist, Dr. A. R. Wallace, some thirty years ago, visited these gardens, but he did not seem to be much impressed with them, or with the management of the place. M. Tissandier, however, affirms that they are the most beautiful in the world. It was in 1817 that the Dutch Government first conceived the idea of founding a botanical garden in Java, and under the superintendence of Van der Capellan the gardens at Buitenzorg were laid out.

In 1837, M. Diard, a Frenchman, was appointed Director, and he laid the foundation for a systematic arrangement of the plants. The gardens at the present day are famous for two things—for the endless variety of tropical shrubs and trees with their strange and beautiful foliage, and secondly for the excellent arrangements made for the reception of the foreign *savant*. Dr. Treub is the present acting superintendent, and M. Tissandier pays a warm tribute to his kindness and to the ungrudging manner in which he lays himself out to accommodate visitors from distant climes who may visit Java for the purpose of seeing and profiting by the lessons given by Dame Nature in this favoured quarter of the globe.

The State keeps up three gardens in Java, although they are, for convenience sake, grouped under one head. Besides the Buitenzorg gardens, which extends over 150 acres, there is an agricultural garden at Tjikeumeuh, extending over some 170 acres, and a large forest garden. The plantations in the third division extend over 900 acres. The mean annual temperature at Buitenzorg is from 28° to 29° Centigrade. Sometimes in the dry season the thermometer is up at 31° C. The growth of plants at the gardens is sometimes astonishing. For instance, some Palms,

*

of the genus Oreodoxa, which were planted out when still quite young to make a border to one of the walks, have grown in five years to a height of 32 feet. Some species of Albizzia moluccana, again, in the same space of time have grown to a height of more than 60 feet. In short, no other botanical garden can show such interesting sections as those devoted to Palms, Ferns, Climbing plants, and Bindweeds in the Buitenzorg Gardens.

A foreigner, when he is about to enter the plantation is provided gratuitously with a plan, and with the aid of this he is enabled easily to find his way to each of the sections. With the aid of his catalogue he can find each species of each family. When he has been introduced to the director of the gardens he is taken to a vast laboratory, where he can study in perfect quiet without any payment whatever.

A small library containing the necessary text-books and works of reference, and a good supply of instruments, are also provided for the use of the foreign *savant*. Close to this fascinating workshop is to be found a photographic laboratory, and a little further on is the Great Library containing a large number of the most ancient works on Botany, together with the most recent editions of standard works. The periodical section is particularly well filled, most of the leading journals on botanical and allied subjects, of each country, being regularly filed.

A whole morning can well be spent in exploring the grounds and buildings at Buitenzorg. In the afternoon, if the traveller be pressed for time, as M. Tissandier happened to be, he can visit the "agricultural garden" at Tjikeumeuh, some twenty minutes' drive from the principal gardens. The route, according to M. Tissandier, was exquisite, the road being dotted with little villas, surrounded with gardens in which each flower vied with its neighbour in sweetness and colour. Dr. Treub accompanied M. Tissandier, and enlarged upon his pet scheme, the "Laboratoire des Savants Étrangers," which was opened in 1885.

Since its foundation, one Russian, one Englishman, and one Dutchman, have worked for more or less time here. The number is gradually increasing, and Germany, Sweden, and Austria have all sent representatives, to M. Treub's delight. France alone, bemoaned the worthy doctor to M. Tissandier, is unrepresented in their visitors' book. Now M. Tissandier has gone, however, this reproach can no longer be preferred.

In the agricultural portions, corresponding, one would imagine, to the Rothamsted estates in England, foreigners are welcomed, and liberally looked after.

To get to the forest plantations connected with the State botanical gardens, a carriage drive lasting some five hours must be taken The picturesque route, however, does not allow one to feel weary. On arriving at Tjibodas you are driven up to the "Pavillon de réception des savants étrangers," situated some 4900 feet above sea level. Inside the pavilion is to be found a comfortable "salon," furnished with a library Here also are bed-rooms and dining-rooms for the use of visitors, for the nearest village, Tjimathian, can boast of no hotel.

The direction of these gardens is in the hands of M. Couperus and ten workmen. Here, in th forest gardens, are to be found specimens of almost every tree and shrub which grows in Australia and Japan. The forest of Tjibodas, in which the garden is situated, is well worth inspecting. Dr. Treub has constructed numerous paths through this forest, and by following these you come out on some fine clearings situated from 6000 to 7000 feet above the level of the sea. Were it not for these paths, locomotion would be impossible, the undergrowth being excessively luxuriant. On the ground are endless varieties of Mosses and Ferns, and on the trees of from 90 to 130 feet are to be found growing in great profusion—Orchids, Ferns, and Climbing-plants.

To describe the beauties of these tropical woods of Java is impossible in the space of a brief article like the present. Dr. Alfred Russell Wallace, on his visit to Java, declared that the plants in the Buitenzorg gardens were not to be compared for luxuriance and beauty to the same species grown in our hothouses. But though we may grow as fine plants in England as are to be seen in Java, nowhere can we produce the wonderful tropical vegetation which so entrances everyone who visits this favourite isle. Where in England, where, even in Europe, can we find any botanical garden such avenues of stately Palms, such endless variety of tropical shrubs, and such clumps of Bamboos, as are to be seen in the gardens at Buitenzorg?

ROOT TUBERCLES OF ALDER, Etc.

Having directed attention to the root tubercles of the Leguminosæ (see *ante*, p. 307), and not long previously to those of the Vine, we would now gather together what is known of the root tubercles which are so common on Alder, and a few other plants. The Alder tubercles are nothing new, but the name of the supposed parasite has shifted since Woronin called it Schinzia alni, and so has opinion with regard to its nature. Previously, some considered these outgrowths as merely cases of hypertrophy; others as resulting from the puncture of an insect; but Woronin attributed them to a parasitic fungus, of which he believed that he had detected both mycelium and spores. When Gravis first examined them, he disputed Woronin's conclusions, and considered the tubercles to partake rather of the nature of galls, and the substance found in the cells as albuminoid reserve-material stored for the purpose of nutrition. Afterwards the same author returned to the subject, and remarked that he had found in some of the cells a viscid mass resembling the plasmodium of Plasmodiophora brassicæ, and in neighbouring cells granules, which might be spores; at all events, that the fungus found in the cells is accidental, and not the cause of the disease.

Möller having pronounced in favour of the plasmodium of a Plasmodiophora (related to that of Cabbage and Turnips), Brunchorst examined the tubercles again, and pronounced against this view, but as the spores had never been made to germinate, he contended that the systematic position of the fungus could not be fixed. On a still further examination, he found precisely the same kind of tubercles on Elæagnus, Hippophae, and Shepherdia; but the structures previously regarded as spores he regarded as sporangia, the contents of which ultimately break up into extremely minute spores. He proceeds to call it by a new name, as Frankia subtilis, although thinking it probably identical with what had been called Schinzia by Woronin, and Plasmodiophora by Möller. But he regarded it as a Hyphomycete, with a mode of formation of the spores peculiar to itself.

In 1886 Frank came forward, and offered the same opinion as that which he had expressed relative to the tubercles of the Leguminosæ, and stated that the spongy parenchyma was full of protoplasm; that the so-called vesicles were nothing but accumulations of newly-formed albuminous substance, contained within the spaces of the porous structure. Hence, that they are organs for the temporary storing up of albuminoids, to be dispersed to those parts of the plant where they are required. Therefore such names as Schinzia alni, Plasmodiophora alni, and Frankia subtilis must be abandoned.

We have only to announce that, five years afterwards, Möller returned to his original position, with a modification, that the tubercles are produced by a fungus, which had been called Frankia subtilis, a Hyphomycete, producing a mycelium, of which each branch ends in a sporangium. That the protoplasm of this sporangium divides into a large number of spores, each of which is capable of germinating, and producing a new mycelium. Thus it remains, as a question of authority, until one or other is confirmed.

With regard to the tubercles on Vine roots, the position remains unchanged from what it was on June 17, 1893, except that perhaps, taking into account these analogous instances of tubercles, the editor was right in his note, that "the mischief done by the slime fungus in this case is not serious."

We need not particularise the olive tubercles which occur on the branches, or those of Ruppia and Zannichellia, which are found on the leaves, as we are now concerned with root tubercles. Neither will we stray further than to name the clubbing of Turnips and Cabbages, of which there is nothing new to relate.

The root-swellings of Juncus and Cyperus would not interest our readers over-much, and they are the produce of a different kind of fungus, belonging to the "smuts," Ustilagineæ, and there is very little doubt about the character of the fungus and its associates. Possibly our British species is Entorrhiza Aschersoniana, but hitherto it has only been recorded in Scotland. Thus ends our record of root tubercles as far as they have come to our knowledge, and we are glad that it is calculated to suppress rather than excite alarm. *M. C. C.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT THE BOTANICAL GARDENS, MANCHESTER.

Not having visited these gardens for a considerable length of time, I was very pleased to find them, on the occasion of a recent visit, showing much improvement. The Cypripediums, of which there are many fine specimens, occupy part of a house of 50 by 20 feet, and were in excellent condition. Mr. Findlay, the curator, does not possess all the latest novelties in these plants, but I noticed such rarities as Cypripedium T. B. Haywood, two plants, one with seven growths; C. Swinburni, a fine plant showing several flowers; C. Arthurianum, C. Charles Canham, C. Mrs. Canham, C. Harrisianum superbum, C. Morganiæ, C. Schroderæ, C. grandiflorum, a fine plant of C. Lathamianum; C. Sedeni is grown remarkably well, several plants in flower. There are also excellent specimens of C. Boxalli atratum, C. villosum, C. Spicerianum, C. Parishii, C. hirsutissimum, C. Lawrenceanum, C. Curtisii, C. Chamberlainianum, a fine plant; C. Roezlii, two very large plants of 2 feet in diameter C. callosum, &c. A dozen examples of C. Charlesworthii were in flower.

In the same house as the Cypripediums are fine lots of Vanda suavis and tricolor in variety, Cymbidiums Lowianum and giganteum.

In a range of span-roofed houses is a number of Cattleya labiata, possessing numerous flower-sheaths, which will make a beautiful display later in the autumn. The Dendrobiums do not number many species; the following were observed: D. nobile, with good growths; D. n. nobilius, D. splendidissimum D. Ainsworthii, D. Leachianum, D. Cooksoni, a fine plant, and D. Findlayanum. Cœlogyne cristata, and the Chatsworth and Trentham varieties of the same are grown in considerable numbers. Lycaste Skinneri in variety is making fine growth. Masdevallias, not numerous, include the rare macrura, and Odontoglossums look promising.

Not only are the Orchids satisfactory as a whole, but the gardens generally have a good appearance for the season.

The exhibition-houses are rendered attractive, the pillars being clad with various species of climbing plants; and stately Palms and other plants form a scene that all must appreciate. As I walked through these houses, I could not but wish that the Royal Horticultural Society was in possession of such fine buildings in which to hold their exhibitions. *R. J.*

which are almost peculiar, among garden Begonias, at any rate, to B. coccinea. In my opinion, this is the handsomest of all hybrid evergreen Begonias. It grows freely, and flowers continuously from early spring till late autumn; and probably it could be had in flower all the year round. The plant shown in fig. 53 was about 2 feet high; and I have seen

flower consists of two roundish sepals half-an-inch wide, and two very small petals. The stems are smooth and green, and the leaves are obliquely cordate, lobed and wavy, 6 inches long, bright green, with a reddish margin, and red petioles, spotted with silvery-grey when young. When starved and cramped in a small pot this Begonia makes a poor

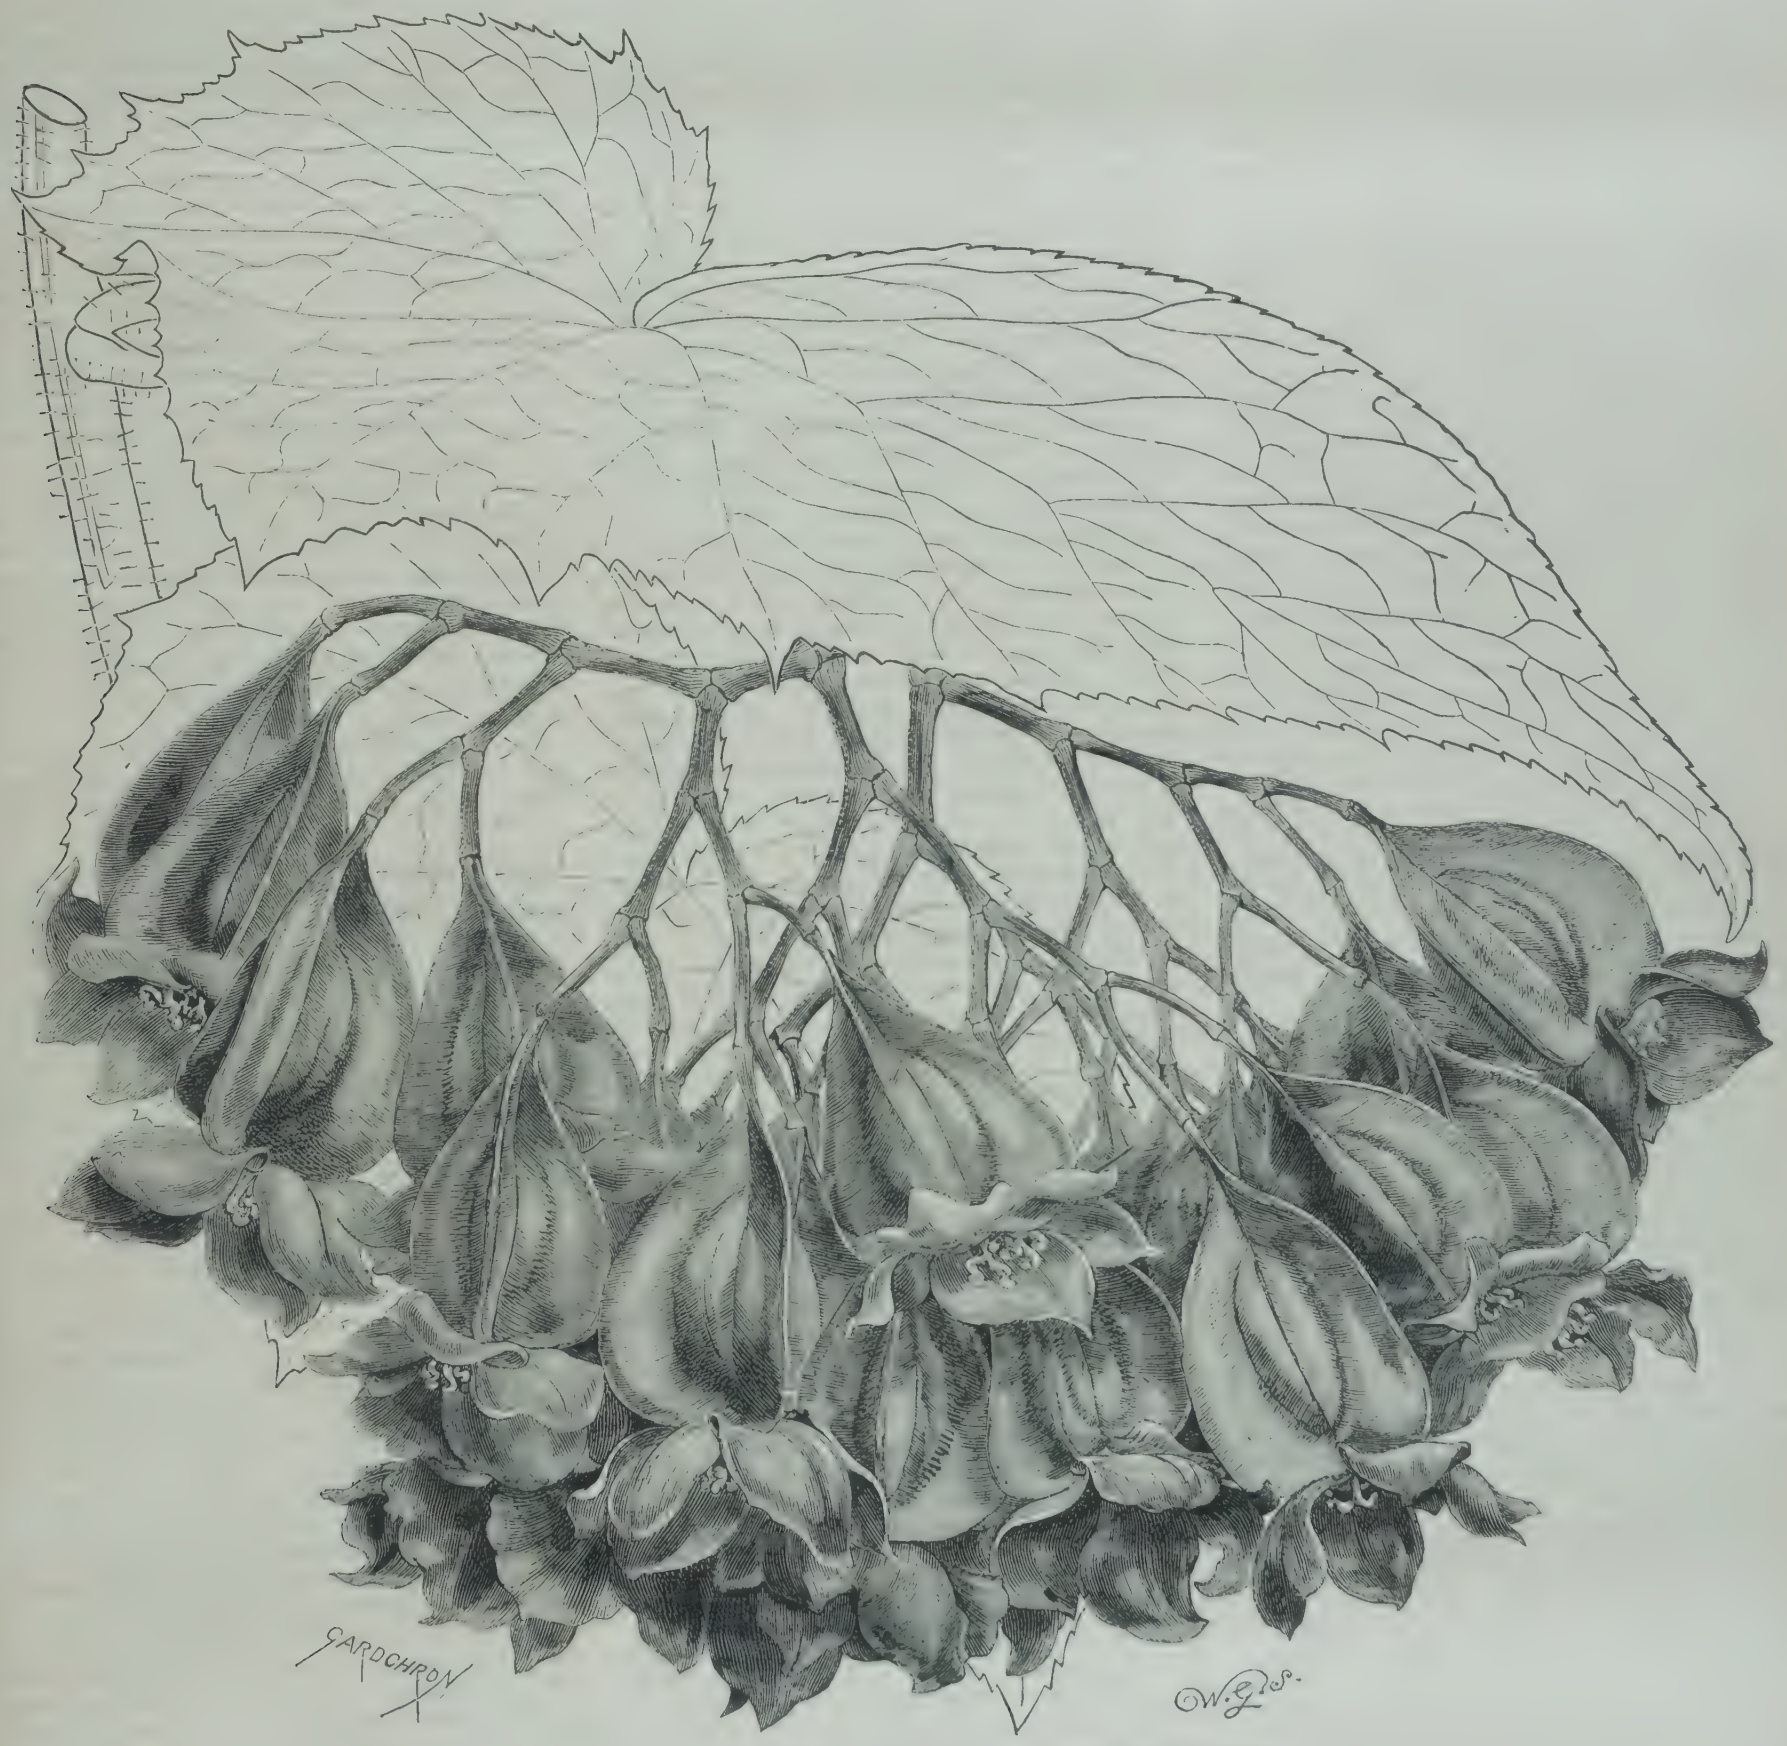

Fig. 53.—BEGONIA PRESIDENT CARNOT: FLOWERS ROSY-CARMINE.

BEGONIA PRESIDENT CARNOT.

M. Crozy, of Lyons, raised this handsome hybrid Begonia, and distributed it three years ago. Its parents, he said, were B. olbia, a Brazilian species, and B. rubra; but no doubt the latter name is a mistake, B. coccinea, commonly known as B. corallina, being meant, the large size and rich colour of the female flowers in the hybrid being characters

plants of 3 feet in height, with bunches of flowers 9 inches in diameter. The female flowers are by far the largest and handsomest, and they last a month or more. The conspicuous winged ovary is sometimes nearly 2 inches long, with wings ¾ inch deep, whilst the petals form a limb 1½ inch across. The whole of the inflorescence, including the pedicels and peduncles, is coloured bright rosy-carmine. The male flowers are borne on separate smaller racemes, and each

show, but when liberally treated it develops into a magnificent plant. No Begonia among the many species and hybrids grown at Kew has been so much admired as this, which is as great an achievement among hybrid Begonias as Canna Madame Crozy is among hybrid Cannas. Another hybrid Begonia from the same parents and by the same raiser is said to be even finer than President Carnot. I have not seen it, but it is called Souvenir de François Gaulin,

and is described as a winter-flowering plant of great beauty, with straight stems, red-tinted leaves, and clusters of about twenty female flowers, each 3 inches long! *W. W., Kew.*

THE ROSARY.

PREPARATION OF STOCKS.

Most amateurs like to propagate a few Roses of their own, and to do this from the first. The time for rooting the various forms of stock is very near now, and as the season is more forward than usual, we shall commence by the end of the present month. The Manetti, Briar, De la Grifferaie, or any strong grower among the Polyantha and Ayrshire section may be prepared as I will describe. One of the great advantages of doing this early lies in the fact that cuttings will callus directly, and make some few roots before winter. They are thus able to stand the drying winds better, and the roots will hold the stock from frost lifting to the same extent as when inserted so much later in the season.

Choose wood half or three-quarters matured, and cut it into lengths of 9 inches. Be careful to select wood with little pith, and without undue coarseness. If we want a healthy Rose, we must propagate from a healthy stock upon foster-roots attached to a plant in good condition. To make up the wood so indiscriminately as many do is altogether against common sense. We must always remember that we do not want any more suckers than can possibly be avoided, as we do not need these to form the main portion of our future plant, in the same way as when propagating Roses upon their own roots; therefore, avoid using those side-growths when making stocks. If we select growth of a suitable character, there will only be from four to six eyes upon each cutting. The bottom cut should be close below an eye, and the eyes cut clean out with a sharp knife, except the two nearest the top. I like my cuttings to be a foot long where plenty of suitable wood is available. We find considerable advantage in this when budding upon them the season after transplanting. When we strike Roses, a shorter cutting is best, and no disbudding takes place.

As the rosebuds worked upon various stocks are now set firmly, we can commence making cuttings at any time, according to the state of our stocks. Some years ago, and even now in a few cases, the cuttings were placed in the rows ready for budding upon the ensuing summer. This is not a good plan, because one not only runs considerable risk of serious blanks from death, but it is impossible to secure so deep an insertion of the rosebud as we should like. Not only is the stock in much better condition for budding, but we can ensure an even bed, bud with greater facility, and be sure of insertion well upon the crown of their roots. By doing a few each year we lose no time, as we simply plant out a few stocks, instead of inserting cuttings for working upon the following season. The shady side of a wall or hedge is an excellent spot for propagating Rose stocks. If a sandy compost can be afforded them, so much the better, and the cuttings should be inserted for fully three-fourths of their length.

A good method of operation is the following:—Turn over a little of the ground deeply with a spade or spud, and when you have got a breadth of a foot or so from the edge of the plot, set a short line across it about 3 inches from the edge of the newly-dug soil. Cut this down with a spade, pulling the loose soil forward into the trench. This will leave a firm bank against which to stand the cuttings. If the soil is not of a fairly sandy nature, it is a great advantage to have a little prepared soil, such as worn-out potting material, and place a small quantity of this in the bottom of the trench, so that the base of the cutting may rest upon a compost more encouraging to root formation. Our plan is to make this partly firm by gently treading along the bottom of the trench. Now press the prepared cuttings into this slightly, and place them some 3 inches apart. Let the depth of your trench be regulated by the length of the cuttings, leaving the top eye just out of the soil while in a loose and freshly-dug state. As the soil settles down, they will be a little more than three parts covered. Turn a little more of the soil against the cuttings, and tread them up firmly, then proceed to turn over more soil as before. When about 18 inches have been dug, set the line 15 inches from the first row. This will be a good distance, row from row, and also allow of a little soil being cut down in preparation of the second trench as before, and so on until the desired number of cuttings are inserted. They root freely enough if done early, and suitable wood be selected. When lifted and transplanted the following year, we must place them at distances varying with the strength of Rose to be worked upon them, and also whether they are to remain in the same spot, or be transplanted after a good Rose bush has been secured.

I must not forget a word or two here upon seedling stocks, nor yet the standard hedge Briars. Seedlings are easily raised; but when selecting the seed choose from a good grower minus those exceedingly small and numerous thorns. Any approach to the minute and numerous thorns of the Sweet Briar should be avoided. Sow now or in March. I have no choice whatever in the matter, and do it when most convenient. Sow thinly in drills in the same way as Carrot-seed—there will be few failures. Leave the seedlings in the seed-bed two seasons, then plant out the strongest for working upon the ensuing summer. Do not fear to use them of no greater thickness than a small packing-needle, for few stocks swell so rapidly as seedling Briars, when they have reached this size. The smaller stocks make grand stuff for a future year if set in thickly. Always shorten the roots of seedling Briars when planting, and thus check that tendency towards tap-roots, and which is the chief drawback to their safe transplanting when turned into Roses. Hedge Briars will need collecting soon, the earlier in October and November the better chance of rooting. Far too many aim at higher stems than are desirable. When they are brought in by the vendors they generally possess a quantity of coarse knobby roots. These are much better if removed pretty severely; indeed, we split the stem off almost as in taking a cutting with a heel of the older wood. So much of this old root rots and decay in a few years. It is also a trouble to lift them without breaking off many of the young roots later on; and as these will form even better upon the healthy heel left when the coarse knobs are removed, it is folly to plant in the rough state so often met with. Hedge Briars are planted about 18 inches apart for full standards, and 12 inches for shorter stocks; the rows being 3 feet 6 inches apart in either case. These stocks may be set into the soil some 9 inches deep; in fact, planted in the same way as I advised for cuttings, except to keep them the greater distance asunder. They are budded the first season after planting, and make maiden Roses the year following. It is a good plan to place them quite as thickly as advised, and then transplant to permanent quarters the autumn following their formation into Roses proper. However carefully we may have trimmed them, suckers are sure to form in more or less quantity; and we have the best possible opportunity of removing these when transplanting, and at a time when most of the dormant eyes will have developed sufficiently to be noticed. *A. P.*

LARGE-FLOWERED MIMULUS IN AUTUMN.

Plants, raised from seed sown in March, which bloomed finely in a greenhouse at the end of May and in June, are now, having been cut down and repotted at the beginning of August, again putting forth very fine blossoms. The strain I am growing is that fine selection from Clapham's known as the Imperial; the flowers very large, stout, finely-formed, and brilliantly spotted with maroon, crimson, rosy-purple, rose, &c., on yellow and white grounds. It is said sometimes that the Mimulus is too fleeting to become a popular plant, but there can be no doubt that the flowers are very handsome, produced with great freedom, and continuous in bloom up to a time when the leading stems show signs of exhaustion, and begin to wither. They should be at once cut away, and then fresh shoots will spring up from the roots, and as soon as these are an inch or so in length, they should be turned out of the pots, a good deal of the soil shaken from the roots, divided if large enough to admit of its being done, and then potted in fresh soil, and the bases of the shoots buried a little below the soil. These soon make a fresh growth, and quickly get into flower; and during the cooler days of September and October, when the atmosphere is moister, the flowers come very fine, are brilliantly coloured, and last longer than in the hotter and longer summer days. It is from this second growth I like to take cuttings of any particularly fine varieties, which root quickly and freely, and soon grow into fine plants, which, if carefully kept through the winter, make strong plants in early spring. Still, some seedlings should always be grown, to obtain something new in marking. Some of the rose-tinted varieties I flowered this season were delightful.

It is sometimes said the Mimulus is perfectly hardy, which is quite true of some of the species, but there is in the case of the fine varieties of the Imperial strain a susceptibility to frost, which should not be disregarded. The young plants should be placed beyond its reach. I have no doubt they would bear several degrees with impunity, but it is the sudden and severe frosts which need to be guarded against.

Dryness at the root in summer should be strictly guarded against, and full sunshine is not desirable. While blooming in the greenhouse [Some cultivators place them in saucers. Ed.], the Mimulus is a thirsty subject, and a little guano placed dry upon the surface of the soil, or given mixed up well with water, and applied immediately after being stirred, is very useful. As soon as the plants begin to decline, they should be stood out-of-doors in a cool shady place until they can be divided, when they should be kept close for a few days, and then placed on the greenhouse shelves. Increase by means of seed is an easy matter. The seeds germinate quickly under cool treatment, but they are so minute, that they should be scattered upon the surface of the soil very thinly indeed. *R. D.*

PARK HILL, STREATHAM.

This fine suburban place is the residence of Mr. Henry Tate, whose magnificent gift to the nation of a picture-gallery on the Thames Embankment with a collection of splendid and costly pictures, has been for some time a matter of notoriety. It is situate at the very apex of Park Hill, which runs up beside Streatham Common, and enjoys some charming views of the surrounding country. The house is large, and superbly furnished, and I had the pleasure of seeing in its capacious galleries many of the splendid pictures which will in time be transferred to London. The grounds are not extensive, but very compact and complete. A noble conservatory corridor leads from the lawn to a far finer Palm-house; the corridor is full of flowering greenhouse plants; the Palm-house is a mass of frond and leaf, everything in superb condition. Beyond that, and enclosing the lower front of the mansion, is a glass corridor, in which were growing many fine examples of Campanula pyramidalis, some of which are of the dwarfer or compact form. The picture-galleries are reached from this corridor. A broad terrace runs along the front of all this glass, and it was in beautiful condition, flowers in beds and vases—the latter particularly numerous, making the whole singularly gay. A dwarf or compact crimson-flowered Nasturtium is here very effective, in spite of the heavy rains. At the bottom of the lawn is a huge rockery, presenting one of Mr. Pulham's best efforts. The sunken character and shaded position renders it

specially adapted for Ferns, &c. Close by, in an enclosed area, are large numbers of glass-houses, devoted to plants of all descriptions, but the collection of Ferns, and all the best foliage plants, especially those suitable for house-decoration, is very extensive. Mr. Howe, the able gardener, does Dracænas well, and has a very fine collection of these striking plants. Particularly effective amongst foliage plants is Phrynium variegatum, the Canna-like leafage much coloured with creamy-white, and particularly useful for giving leaf-colour to plant groups. There is a fine lot of plants, though some are branching rather than erect, of the fine crimson-coloured Celosia pyramidalis, of the Maiden Erlegh Stock—and all sorts of things, in fact, in rich profusion.

Mr. Howe has frequently shown from this garden some grand Grapes. Alicantes are in fine form, but the chief house of this variety is planted with one Vine only. It has been cropped in this way some ten years, carrying from 80 to 100 fine bunches, the which now averaged some 3½ lb. in weight. It is by no means a large house. The chief vinery range has an excessively long sharp pitch roof, and that is not good for Grapes. Hamburghs have been very fine, but are now fast disappearing. Superbly as originally coloured, the colour wanes if kept hanging long after on the Vines. Gros Maroc, Gros Colmar, and Muscat of Alexandria are the chief other varieties grown, but for indoor use big bunches are not desired, hence there is no attempt to induce these to carry show samples. A fine densely-green Melon, unnamed, that is described as one of the finest-flavoured, is cropping well. So also is Lockie's Perfection Cucumber, which is so much favoured at the table. Tomatos, too, are largely and well grown, but it is a distinct relief to learn that Mr. Howe has no specialty. He grows Melon Perfection, Ham Green Favourite and others, and most highly-prized for its high flavour, beauty in clusters, and abundant cropping, is Sutton's Red Dessert, which is so greatly appreciated as a table fruit. The yellow form Golden Nugget is equally pleasant as a dessert variety.

The kitchen gardens are not extensive, as the area which was formerly used for that purpose has been parted with. Still, there are plenty of good vegetables of most descriptions. There are, as everywhere, heavy crops of Pears, and some good Apples. In some frames seen are Gloxinias of the famous Reading strain are very beautiful, specially so is the white-and-red Duke of York, and the rich scarlet, both wonderfully true from seed, a very important thing in named stocks of Gloxinias. *A. D.*

BLECHNUM *v.* LOMARIA.

As the recent issues of Mr. E. J. Lowe's little book on *British Ferns*, and Mr. G. Schneider's more comprehensive book of *Choice Ferns*, both contribute to substitute the name of Lomaria Spicant for our native species popularly known as Blechnum Spicant, it would be of considerable interest to British Fern-growers to know whether this alteration is justified. In Mr. Lowe's book, the specific distinction between the two species is not stated, nor is a description given of the Lomaria form of fructification. In Mr. Schneider's book, however, the definitions are clear enough. In Blechnum "the involucre (cover) is membranous and distinct from the edge of the frond." In Lomaria, the sori "are covered by an involucre of a parchment-like texture, formed of the revolute (curled up) edge of the frond." We have therefore a perfectly clear issue before us, viz., that if our native species known as Blechnum has its sori covered by a membranous indusium, altogether distinct and independent from, and situated well within the margin of the frond or pinna, it is a Blechnum, and not a Lomaria. Mr. Britten in his *European Ferns* (p. 64), not only treats of the plant as Blechnum Spicant, but gives wood-cuts of the specific differences described, and quotes Mr. Moore as a corroborative authority thus: "The distinction between Lomaria and Blechnum becomes easy when full force is given to the technical characters assigned to each respectively. The peculiar character of Lomaria is that the sori are produced at the margin, whilst the characteristic of Blechnum is to have the sori distinctly within the margin, and near to the costa. Thus in technical and exact terms, the sori of Lomaria are marginal, and in Blechnum costal or intra-marginal. The fructification of Lomaria is determined by the indusium being a continuation of the margin of the frond, which becomes membranaceous, and is inflected over the spore cases. The fructification peculiar to Blechnum, on the other hand, is known by the indusium springing directly from the under surface of the frond, the margin extending beyond."

There is clearness of definition; and all that should remain to decide the question is the plant itself—a fertile frond of which I enclose, maintaining that it is Blechnum Spicant and not Lomaria, on its own evidence and the preceding definitions.

I would not trouble to contest the recent rulings were I not cognizant that the alterations of old and well-known names, of which B. Spicant is one, is a source of great vexation and confusion to many Fern-lovers. Nomenclature is a puzzling question enough without having confusion worse confounded by alterations such as here involved, which are contradicted not only by good authorities, but what is far more, by the evidence of the plants concerned. I and many of my *confrères* would be very glad of the editor's pronouncements on the specimen found herewith. *Chas. T. Druery, F.L.S.* [Please send another specimen. Ed.]

A TRAVELLERS' NOTES.

(*Continued from p.* 310.)

Sydney: *May* 31.—The Bulli Pass, one of the prettiest spots near Sydney, lies due south, and but a few hundred yards from the open ocean on the Kiama line. *En route*, 18 miles from Sydney, the National Park, an immense area of 40,000 acres, is traversed. To a great extent it is in a state of Nature, and the vegetation apparently not luxuriant, doubtless owing to the poorness of the soil.

Near Bulli, in sandy soil interspersed freely with irregularly-shaped boulders, often of great size, Doryanthes excelsa is thoroughly at home and multiplies freely. The foliage is of the palest shade, a tint spreading to the flower-stalk, which is slight, straight, and from 8 to 10 feet in height. At this season no flowers are to be seen, though undeveloped heads are frequent, oval, pointed in shape, and of the brilliant blood-crimson colour, the more advanced spikes glistening with gummy exudation.

Epacris flower on the sides of the cuttings, and carpets of Bracken cover every available spot. In the district is good coal, glimpses of the collieries being frequently obtained on the slopes clad with tall Eucalypti.

A good road leads up the pass, at the foot of which masses of gaily-flowering Lantanas have become a weed, not however to such an extent as the Bramble, veritable tangled shrubberies of which line, at intervals, both sides of the road for the whole of the ascent, only some 1000 feet.

A panoramic view of the country beneath, laying beyond the forest at the foot of the hill, with the open ocean beyond, is afforded during the ascent, and above all from "Webber's Look-out" on the extreme summit. Corypha australis is very fine, on tall, straight stems, 50 to 60 feet in height; Seaforthia elegans no less so, with many heads of flowers. Alsophila australis, A. MacArthuri, and A. Cooperi are frequently met with, though much of the latter has been removed by enterprising collectors.

Fixed to the smooth white stems of the Eucalypti, or clamped firmly in the forks of the main branches, are specimens of Asplenium Nidus, in some instances of considerable size; whilst in the general shrubbery are such well-known plants as Doryphora Sassafras and Pittosporum undulatum. In the village gardens on the plains beneath, a favourite tree is Erythrina speciosa, now rapidly losing all its leaves and opening its superb scarlet blooms, large specimens offer a magnificent spectacle.

In addition to the National Park, Sydney is well provided with open spaces, both in and on the outskirts of the town. Chief amongst these is the new Centennial Park of 700 acres but recently opened. Avenue planting has been done, roads and rides laid out, due provision made for the protection of the numerous wild duck on its lakes, and the whole fenced in, in a massive and efficient manner; as it is, however, in the dawn of its existence, the trees have attained no size, and there is little to remark beyond suitability of site, and the wisdom of apportioning such an area for public purposes near the heart of a large city. With the two Domains, Moore Park, Hyde Park, the Centennial Park, &c., Sydney has no lack of open spaces. The chief planting tree, growing with freedom and yielding unrivalled shade in Hyde Park and the Domains, is Ficus macrophylla. *James H. Veitch.*

(*To be continued*).

FORESTRY.

THINNING FORESTS.

(*Continued from p.* 368.)

The shelter group and the belts were thinned early, to encourage sturdy growth, and enable them to resist the winter gales. In March, 1865, I took up a cart-load of Spruce and Silver Fir from the head of the wood for another plantation. In May, 1866, thinned Larch near the river, by cutting holes through the thickest parts.

In June, 1866, I cut through the field, part in serpentine-lines, from corner to corner, diagonally, the cuts crossing in the middle. Thinned Scotch Fir at the head of the wood and shelter-belts. In May, 1866, we knocked off several Oak that had grown from the stools of timber that was felled in 1855, and found that the part attached to the decaying trunk was much smaller where it springs from the stool than it is higher up, the extra size being fed by roots springing from its bark, where it is embedded in the earth. This accounts for the shoots from the stools making much more rapid growth at first before any of the old root has died, than seedling Oak, as they are fed by the roots of a large tree, and for their not making so much growth afterwards from the old roots dying. After their death, it is only supported by the new roots it has made. Seedling Oaks make the best trees afterwards. In March 7, 1867, we thinned south corner of the wood; thinned shelter belts regularly. On June 12, 1871, we began cutting a road through the wood, from the path at the bottom, sloping up the side of the hill towards the south-east boundary; cut 359 Larch. On June 7, 1872, turned the road to southward, cut through a rock 14 feet high, and continued it to the lower corner of the wood, where a group of Oak trees remains, part of the old wood; 5 feet were cut off the rock, and 9 feet built up with a dry wall. In June, 1873, cut Larch in lines. In May, 1874, cut out young Oak among the Larch in the lower part of the wood; Spanish Chestnuts have every leaf turned brown by the late frost in the low ground, 20 feet high; some are cut nearly at the top of the wood. In May, 1871, I cut a quantity of young Oak, and a few Larch. Finished the road to the field part, and made a wide cut, nearly as wide as the height of the trees, as the trees had killed all the grass and Brambles, and were dying. Carpenter half a day; eleven dozen Larch. In 1877, began cuts, taking two trees and leaving eight from lower road to north-west. In 1878, made cuts from new road to north-west, between the cuts that were made up to the road. In 1879, made cuts above the road in wood part in May; cut in field part in October, where the trees were thickest. In 1880, cut young Oaks in the cuts that were made the last three years. In 1881, began a cut parallel to the new road, leaving twelve trees between it and the road, and taking down three trees out of fifteen. In May, 1882, continued the cut parallel to the road, and took out long thin trees from field part, where they whip the larger Larch. In May, 1883, made a cut parallel to and above the last at 48 feet distance. In May, 1884, cut dead and suppressed trees. In May, 1885, cut young Oak trees. In May, 1886, cut dead and suppressed trees. Professor H. Marshall Ward and my son who has studied forestry for two years, went through the wood; they do not think the leaf-canopy sufficiently preserved, and advise no cutting of poles for some years. In May, 1887, cut suppressed trees and

forty-three dead Larch. In 1888, cut suppressed trees and thirty-three dead Larch. In 1889, cut dead and suppressed trees; and in 1890, 1891, and 1892, during May. September 20 to 27, 1892, cut branches off Spanish Chestnut and Oak with a saw, using a light ladder. In May, 1893, cut suppressed trees and forty-six dead Larch. May, 1894, widened the roads, converted the path at the bottom of the wood into a road, and rooted nine trees; one measured 15 feet 7 inches.

On page 752 in the *Gardeners' Chronicle*, June 16, 1894, "L." writes: "The good old rule of hard wood being thinned out to half the height of the trees, and Pines to one-third their length is now, not always, but I am sorry to say far too frequently forgotten." If any beginner in plantation management follows "the good old rule" he will not find the trunks of his trees very long.

In conclusion I would say that over-thinning is much more injurious to plantations than allowing them to grow too thick. My brother allowed workmen to take out every other tree from a plantation of about ten years' growth. The result was, the annual growth of the trees was reduced from 18 inches to 3 inches the first year after the thinning, and the trees took some years before they grew well. It is not good practice to thin the whole of a large plantation the same year, as it is usually done at the coldest and stormiest part of the year. The whole plantation is chilled, and its growth checked for some years. I have seen plantations of thirty or forty years' growth thinned regularly, leaving no two trees touching each other, with very bad results, the growth of the trees coming to a standstill for years, from the sudden exposure and the sun drying up the soil, and depriving the trees of one of the principal factors in tree growth—moisture. *H. R.*

THE SEED TRADE.

The Grass and Clover Seed Crops.—We are now able to estimate pretty accurately the yield of seeds grown so largely abroad for agricultural and garden purposes. Like many of the seed crops in this country, those of natural grasses were very promising in the early months of spring, but advices from Darmstadt are to the effect that, with very few exceptions, there was a great change for the worse in the course of the summer.

Natural Grasses.—Bent-grass (Agrostis) of all kinds promise a short crop, not only in southern Germany, but also in the United States of America; but, while cold, wet weather has considerably lessened the crop in one case, the severe drought in the States has had the same results. Of the Hair-grasses (Aira), A. flexuosa, which is useful for sheep-feeding on dry natural pastures, has been harvested in fair quantities, but quotations cannot be low, as there are no stocks in hand. Meadow Foxtail (Alopecurus pratensis) has this season produced a crop inferior even to that of last year, the late frosts in May having materially damaged the development of this valuable grass; the produce appears to be only about one-half of what was harvested last year, and prices have advanced in consequence. Sweet Vernal (Anthoxanthum odoratum) is a very indifferent crop, the whole output being extremely limited. A. Puelli has succeeded very well, but it does not appear to be in demand in this country. The crop of false Oat-grass (Avena elatior) is a fair average one, and the quality proves to be excellent; the German growers advise that early orders be sent, as the earlier receipts of this grass are always the choicest, both in colour and quality. Brome-grasses (Bromus), for the most part of rough quality, disliked by cattle generally, as they contain but little nutriment, have produced average good crops. The yield of crested Dog's-tail-grass (Cynosurus cristatus) is, without doubt, more abundant than has been the case within the last three years; but, it is stated, the colour will not be good, on account of rain. Cock's-foot-grass (Dactylis glomerata) has failed this year in New Zealand, where it is largely grown — the weight is light, the colour bad, and the germination low. The American (States) crop is an average, and the germination very high; but there will be heavy loss in cleaning, owing to the impure character of some of the samples. There is a fair average crop in France of the Fescue-grasses, the Hard (Festuca duriuscula), and the Sheep's (F. ovina), have produced seed in larger quantities than last year, and prices rule more reasonable, but as the seed is being rapidly taken up by dealers, in the absence of last year's stocks, prices are rising. The yield of the narrow-leaved Fescue-grass (F. tenuifolia) is good, indeed, rather plentiful. Meadow Fescue (F. pratensis) shows about the same yield as last year, and prices will rule as in 1893. Tall Fescue (F. elatior) shows a satisfactory yield, but the area of the crop being limited, the supply will correspond. The Woolly Soft-grass, or Yorkshire Fog (Holcus lanatus), shows a fair crop of good quality. Timothy-grass (Phleum pratense) is a partial crop in the States, and prices advance rapidly. In Germany it is a late crop, and nothing definite can yet be learned as to the probable yield. Of the meadow grasses, the Wood (Poa nemoralis) is a good average crop, but the colour has suffered from the rain. The Rough-stalked (P. trivialis) has been harvested in satisfactory quantity; the seeds are ligher in weight than usual, and somewhat discoloured. The Smooth-stalked (P. pratensis) is a good crop, excellent in colour and quality. Of the Rye-grasses, the Perennial is reported to be promising, but it is expected the weight of the seed will be light. The Italian has given good results, both in France and Great Britain, and normal prices will rule.

Clover Seeds.—It is early to report on these with anything like certainty, but Sainfoin will probably be plentiful, though rain has affected the quality, and it is thought prices will be lower than last year. Trefoil has proved a plentiful crop of fine colour, but as there are no old stocks on hand, prices are likely to be high. White Clover is thought to be below the average, while really fine samples are rare. Of Alsike Clover there is a satisfactory crop in the United States, and very fine samples are offered at fair prices; German-grown seed is not yet in the markets, but the yield is regarded as an indifferent one. Trifolium incarnatum has been plentiful in all producing districts, and prices have reached a low level. Of Red Clover, the United States appear this season to show a below-average yield; but there are, it is said, large yields in Hungary, Galicia, and Bohemia. From Italy has come new seed of good quality, but as the reports from America are not favourable, there is an advance in prices. France and Italy both show a large crop of Lucerne.

The continued heavy rains, and complete absence of sunshine, have seriously impeded the drying and threshing of most of the grasses, and deliveries are, therefore, slow, making it difficult to fix definite prices at present.

THE HERBACEOUS BORDER.

CHRYSANTHEMUM LACUSTRE AND COREOPSIS GRANDIFLORA.

There are two hardy plants that are well worth growing for cutting at this season of the year; they are Chrysanthemum lacustre, and the golden-yellow Coreopsis grandiflora. I planted a long line of the former in order to form a boundary line between my own land and that of my neighbour, and an excellent summer fence it makes; and it is now, and has been for some time, a perfect mass of bloom, supplying bushels of cut flowers if required. It grows freely; indeed, it will grow in any soil, and a clump spreads rapidly, soon attaining to a large size. I find that the flowers stand well in water in a cut state, and they are decidedly better for indoor decorative purposes than the white variety of Anemone japonica, which unfortunately soon sheds its petals, even when cut young. In the new Lammas Public Park at Ealing, there is a border of hardy shrubs and flowers, and chief among the latter is the Chrysanthemum under notice. It is full of bloom, and associates well with evergreen and deciduous shrubs; while it is so hardy that, so far as my experience goes, the hardest frost will not injure it.

It is not difficult to have two seasons of blooming of the golden Coreopsis grandiflora, one early in the summer from plants left over from last year; the other from seedling plants, the seeds of which are sown in June and July, and which, of course, bloom later. But both are very persistent in flowering, and their continuity is no doubt helped by the cool moist season. In the somewhat moist sandy loam of my seed-grounds at Bedfont, both these plants bloom freely, and this is a result of making strong rootstocks in the holding soil. In the finest stands of cut blooms of hardy flowers, I saw at flower shows during August and the first two weeks of September, Chrysanthemum and Coreopsis grandiflora were almost invariably among them.

I have this season bloomed a batch of seedlings of C. lacustre, but so far there is little, if any, apparent departure from the type. No doubt, the fine forms which have been shown on two or three occasions during the summer were seminal varieties, and that some show produce flowers larger in size than others, is perhaps not to be wondered at. Such improvements soon cease to be rare, because it is possible others may obtain the same results in their seedlings, and it would appear finer forms of this useful perennial have appeared in two or three places during the past three months. *R. D.*

Anemone japonica.

The varieties of Anemone japonica are among the best and most useful in the garden in the early days of autumn, as regarded from the purely ornamental point of view. Especially so are the snow-white variety, A. japonica, the type with warm rosy-purple blossoms, and alba, or Honorine Joubert. The intermediate pink-shaded variety known as A. j. elegans is distinct and pleasing enough, but for bold masses of colour and where an effect is wished to be produced when viewed from a good distance, I should favour the first two kinds. A. Honorine Joubert is valuable in many ways, and can be associated with other plants, both planted and in a cut state. The type possesses a shade of purple which is not found in other garden flowers in the autumn season, and should on that account find favour. Any good ordinary soil suits this species, and position is not a matter of consequence. The rhizome frequently wanders wide from the parent plant, and encroaching often on other plants; still, they are easy to keep within bounds, and places in most gardens might well be occupied with them where they could remain a long time without disturbance. This is a point of importance in the culture of the plant which should not be overlooked. They are also among other places specially well suited for planting at the foot of a warm sunny wall, and, indeed, seem to attain perfection in such positions more readily than they do in the open border, which in a measure may be due to the protection afforded them by the wall in the winter season. I have more than once seen these plants attain to 5 feet high in warm snug corners, yielding abundantly of flowers a long period of time.

Rudbeckia Newmanii.

A useful late summer and autumn flowering perennial of dwarf habit, one of the best border plants; of easy culture, and readily increased. The plant has a cushion-like habit of growth, with abundant foliage, from out of which the numerous flower-stems arise. These, when fully grown, are of a golden-yellow tint, with a jet-black disc. The plant is about 2 feet high, compact, vigorous, and hardy, good forming for masses. *J.*

NOTICES OF BOOKS.

Anleitung für Pflanzensammler. Von Dr. Udo Dammer. (Stuttgart: Ferdinand Von Enke.)

This is a very compact and serviceable treatise on the methods of collecting, preparing, and conserving plants, and parts of plants, for purposes of study. Not only is the general method of drying plants for the herbarium treated on, but special sections are devoted to collections for special purposes, pathological and teratological, and to the formation of illustrative series of leaves, fruits, woods, Ferns, Algæ, Lichens, fungi, &c.

Fungi and Fungicides: A Practical Manual concerning the Fungous Diseases of Cultivated Plants, and the means of Preventing their Ravages. By Clarence M. Weed, D.Sc. (London: Kegan, Paul, Trench, Trübner and Co., Charing Cross Road.)

This is an unpretending but very serviceable little book, treating of a selection of the more common fungi affecting fruit trees, ornamental plants, vegetables, cereals, and forage crops. It covers much the same ground as is partially occupied by the similar works of W. G. Smith and Marshall Ward, but has the advantage of being more comprehensive than either of these. A description of the diseased conditions, and of the fungus causing it, is given in each case, the descriptions being illustrated with wood-cuts or process-blocks, which do not compare favourably with the illustrations given in our English books; in addition useful references are given to the literature of the subject.

The methods of prevention and the remedies are detailed in each case, great stress being laid upon spraying with Bordeaux Mixture and similar compounds, with or without the addition of arsenites (London Purple and Paris Green). It is very astonishing that our cultivators should be so slow to adopt the methods of spraying as a preventative against the enormous losses now sustained, but we may hope that one result of the technical education scheme now being worked in various ways will be to diffuse information on these matters. Lecturers and students will find this little volume useful to them. It will, we may hope, be the precursor of a similar book, adapted to British requirements, and containing information on a number of diseases of cultivated plants not given in any book yet published in this country.

Agricultural Zoology. By Dr. J. Ritzema Bos. Translated by J. R. Ainsworth Davis. (Chapman & Hall.)

Professor Davis has executed a very useful task in publishing this translation of Dr. Ritzema Bos' work, as there is no book in the language that we know of that so well covers the ground. Without overloading the book with technicalities, which in this case would be superfluous, the author gives an accurate and clear account of the several classes and orders of the animal kingdom, illustrating his statements by a more detailed account of those particular species which are of the greatest importance to the farmer. The general structure and appearance of each animal is described, and details are given as to its habits and the method of preventing their ravages. The author has even a good word for the fox, which, in spite of its preying on domestic poultry, game birds, &c., affords some compensation by feeding on rabbits and voles, whilst he does not disdain cockchafers, worms, and snails.

Insects naturally occupy a large proportion of the book. Sometimes the remedies prescribed, though doubtless effective, are not such as could be carried out on a large scale; for instance, it is true that thousands of crane-flies may be caught with a net, but we fear the thousands so caught would only bear a fractional proportion to those left. The ravages effected by mites are only partially dealt with, possibly because fruit-culture is considered to be a thing apart from that of farm-plants proper.

Eelworms, which are such a plague to growers of Carnations, Cucumbers, and Tomatos, come in for a share of notice, but unfortunately we are not told how we may rid our plants of these pests, nor of the steps to be taken to free the soil from them. In the case of plants grown in pots, measures can be taken which would be impracticable on a large scale. Preventive measures, however theoretically serviceable, would practically often be worse than the disease—take the slug, for instance. We are recommended to protect their natural enemies—well and good; but what are the natural slug destroyers? The answer is, "pigs, moles, shrews, ducks, fowls, pigeons, rooks, starlings, and toads." It is evident the remedy must be carefully selected and administered in small doses, and its action carefully watched by the practitioner! The work is adequately illustrated, but it lacks an index. Though intended primarily for farmers, much of the information is of value to the gardener also, and in another edition a few supplementary pages, dealing with the pests which plague the gardener, might advantageously be added.

Home Correspondence.

Potatos in 1894.—The crops this season are not so good with us as they at one time promised to be, the early kinds however turned out well; and some of the later sorts, of which there were about forty on trial, have done well considering the character of the season, some being free from disease, and others not so badly affected as was at one time expected. All the crops have now been lifted. In these brief notes the kind of soil is indicated, the mode of treatment, and the results. Our ground is a heavy loam of a good depth, which retains a considerable moisture a long time, and therefore not the best for Potatos, particularly those of robust growth. The ground was dug in the autumn, and left in a rough state till planting time came, when it was broken down and pulverised with the fork. Drills were then drawn about 3 inches deep, our object being by so doing to keep the tubers near the surface, so that the ridges would be drier should the season be a wet one. All varieties were treated alike, and after the drills were drawn, kainite was spread down the rows at the rate of about 4 cwt. to the acre. The sets were planted in the last week of March, these having been spread out all the winter on shelves in a light airy shed. Some sets had growth of ½ inch long, while others were scarcely started. The warm weather which succeeded caused the most forward sets to push through the soil in the first week in May. Remembering how we suffer in this part from late spring frosts, I had the tops covered whenever they pushed through the soil, so that but few of them got nipped by frosts at the end of Whitsun week. Lifting the early varieties was begun at the end of May, and a finer crop I have seldom had, not a tuber being diseased. Of the early varieties, Myatt's, Veitch's, Rivers', and Sutton's Ashleaf were good alike, and very little difference in them, either as to goodness of quality or amount of crop. The second earlies were under-sized, as they stopped growing too soon. The mid-season and late varieties, strange to say (though Sutton's Supreme seemed to be affected the worst of any with the blight), had not more than half-a-dozen diseased tubers in a bushel of them when lifted. Edgecote Purple was also good, and very few of them were affected with the blight. Abundance, Best of All, Windsor Castle, Triumph, Supreme, and Satisfaction did well. The same may be said of Chiswick Favourite and Vicar of Laleham. Record was a poor crop, and very much blighted, as were Empress and Renown. Rising Star and Invicta were fair. The variety Quantity-and-Quality was a good crop, with but few diseased tubers; they are, however, too coarse for the best table. Crimson Beauty was much diseased and a poor crop, as was Epicure; while Marvel had a fair crop, with but few diseased tubers. Marvel has a nice shape, short haulm, and good flavour. Purple Perfection was the heaviest crop of all, there being scarcely any diseased tubers. Prolific, a good-shaped tuber, was a good crop, but it is not a fine quality. Fink Perfection has a good shape, and that is its only recommendation. Monarch and Colossus were both grown, but neither of them was of good quality. Here, then, is a list of varieties, a number of which are of but little use in an ordinary garden, as they make too much strong growth, while the quality in some cases is poor. Of early varieties, in my opinion, there is none to compare with the Ashleaf; and for mid-season and late ones, none are better than Windsor Castle, Triumph, and Supreme. *H. C. Prinsep.*

The Conference on Trees.—I shall be glad if you will allow me to refer to the remarks of Mr. Thiselton-Dyer at this conference, in reference to my paper, as, I think, he must have been under some misapprehension on the subject. You report him to have said that:—"He must say that he was much struck with the fact that the writer of the paper really answered, with almost destructive criticism, many of the suggestions raised in his own paper. There seemed to be some confusion in the matter. A landowner with an attractive estate planted trees for various purposes—for shelter, or to a very large extent from considerations of landscape effect. Of course, in so doing, he had his reward in the pleasure he derived. Such actions ought not to be regarded from a commercial point of view. There was, in point of fact, very little in this country of what could be called forestry. That arose from various considerations, and he would not now trouble them with details. On the continent, however, forests to a large extent belonged to permanent bodies, such as the Communes in Switzerland, and other great corporate bodies. Therefore such bodies could, if they liked, project the expenditure and the expected profit into the next century. That was impossible for the private landowner in this country. He did not agree with the writer of the paper that English landowners were less astute than foreigners, although it was the fashion to say so." It is not clear from the above where the "destructive criticism" comes in, but I am under the impression that the paper of mine that was read at the conference is in almost entire agreement with the above paragraph. I was careful to state that my paper referred exclusively to the production of timber. I have not confounded the planting of trees for shelter, &c., with planting "from a commercial point of view," but have distinctly stated that such plantations "need not be reckoned upon for the production of timber, and hence should not be mixed up with the latter subject at all," and I have also stated my belief that waste-lands can only be made profitable by planting under specified conditions, and the very best management. Neither have I stated that "English landowners were less astute than foreigners," although Mr. Dyer appears to think so himself, when he says that, "in point of fact, there was very little in this country of what could be called forestry." I cannot say I am in sympathy with Mr. Thiselton-Dyer's attempt to dissuade the Society from making "the public believe it, as a Society, had any distinct views" on the subject of forestry. The Society might draw the line somewhere if it saw fit; but to suggest that it is to have no distinct views of any kind on a subject in which it is deeply concerned, is, in my opinion, timid counsel, especially from such a source. *J. Simpson, Wortley.*

Veitch's Climbing French Bean.—Like other Runner Beans, the above requires to be planted at not less than 10 inches apart, in single line, on heavily manured and deeply-trenched land, or in trenches like Celery, the stakes used for them to cling to being not less than 7 feet above the ground. It is a variety I have grown for more than thirteen years, and fail to understand the cause of its being so long in getting generally known. *H. Markham.*

Lessons of the Great Fruit Show.—The first is, that we should in market-fruit culture utilise to the fullest extent the more favoured parts of the Kingdom, especially those south of the Thames. Whilst last year the unusual heat brought hardy fruit to a remarkable degree of perfection everywhere, it is but too obvious that such seasons come only too seldom. This present season we see no such fine finish to fruit generally as was evidenced last year, and the present season is but a type of many. The very best finished and finest fruit, and therefore the most profitable of fruit, came to the Crystal Palace chiefly from Kent, and that county still stands at the head of all other counties as the great hardy fruit district of the Kingdom. But Sussex and Surrey have on both chalk and sand hardly less favourable sites for fruit culture than Kent has, and certainly these three south-eastern counties of England do present the most favoured field for fruit culture, they get more of sunshine, the air is purer, and they have generally better and warmer subsoils for the trees. Then, so far as competitive classes are concerned, it is evident that to give all growers a fair chance, counties require to be grouped, so that competitions may be in the respective classes limited to growers in those groups. It is obvious always that growers in the eastern, midland, western, or south-western counties have no chance against the growers of the south-east. They have not the same fine climatic conditions. Much as Maidstone is to be congratulated on the comparative success in certain classes made by Messrs. Woodward, Mackensie, and Killick, yet, is it not discouraging to growers in other districts, less highly favoured, who feel how poor is their chance in such a open competition? If it is desired by these fruit exhibitions to offer encouragement to fruit culture everywhere, then some better method of apportioning the classes must be adopted. No doubt Maidstone is proud, but fruit shows do not exist solely for the glorification of Kent. The packing competitions were disappointing.

In no sense was anything seen superior, and in some cases not so good as when similar competitions were furnished at South Kensington. Peaches showed nothing new; and the competition in packing utensils was so limited as to be almost devoid of interest. *A. D.*

BRITISH FRUIT AND ITS PRICES.—I have had my attention drawn to your article on this subject, and to that portion relating to myself especially, and also the last seven lines in which you are pleased to give your opinion of my friend, Mr. R. D. Blackmore, others, and myself. You say "how threadbare the whole thing is, and yet how fresh it seems to be to the writers in the *Times* in the *silly* season" (the italics are mine). You say also Mr. Harrison Weir endorses Mr. R. D. Blackmore. My letter had nothing to do with the salesmen or the prices of fruit further than those quoted by Mr. R. D. Blackmore. I am by no means unfrequently asked my opinion by persons anxious to know about, and to invest *their little all* in fruit-growing; therefore what I said was to place before such people what they had to contend with, and then leave it to them "to invest" if they thought proper. You say the matter is "threadbare," &c. This I deny. The conditions of fruit growing *are changing every day*, and the foreign competition *is growing*. I should not be doing my duty to my countrymen, knowing what I do of fruit-growing, if I did not point this out to them. You are pleased to call this in an indirect way, "silly." I never said a word about salesmen's dues, &c, which you "in words" have "rambled" about. Neither is the matter anything like so *threadbare* as that we often get about Grapes and other fruit growing under glass, &c., which is so *ad nauseam*. However, I am more astonished at the denseness of the following remarks: "For these gentlemen the Royal Horticultural Society, its fruit conferences at Chiswick, its fruit committees in Victoria Street, and the Horticultural press of this country, might just as well have not existed." Now, Mr. R. D. Blackmore and myself are both members (and now appears that we are very unworthy members), of the Royal Horticultural Society, and I am one of the Fruit Committee, and have been for many years, and I have been connected with the Horticultural Press for a considerable period. So this assertion comes on me as a new revelation that the Royal Horticultural Society has anything to do with the price of fruit or salesmen, &c. What the Society has done and is doing is in the way of promoting the growth of the best fruit, and of new varieties, and it has gone as far as to gain information as to *packing*, but not the selling of it; nor has it ever, so far as I know, concerned itself as to its *distribution* in any way, nor possible or actual *competition*, or how it should be met. And yet the writer of the article draws the inference that because a few men discuss the prospects of *profits*, *distribution*, and *competition*, we are told we are "silly," and that the Royal Horticultural Society is of no use to such men. I am an old man, and have seen, heard, and read much in my time, but anything more ridiculous or absurd has never come before me; and I feel that I must also add, that if there is anything 'silly" about controversy, it does not rest entirely at least with the writers in the *Times*. *Harrison Weir, F.R.H.S., and One of the Fruit Committee.* [Our valued correspondent is under a misapprehension. We were not silly enough to impute silliness to him or anyone else. But it is a fact that the correspondence appeared in what is called the "silly season." And it is also a fact that the questions have been threshed out over and over again, although we believe not a word to that effect was stated in the *Times* correspondence. Mr. Weir has, for instance, overlooked the full discussion that took place at a deputation to the Board of Trade last spring, and has forgotten the discussions on fruit culture for profit at the Fruit Congresses, especially that of 1888, at Chiswick. It seems to us that enough has been said on general principles; it is now more than time to act. Ed.]

FOREST MANAGEMENT.—A good deal has been written lately of various kinds on the subject of forestry, but very little of it contains anything of the least use to anyone practising planting. It is, therefore, very refreshing to read Mr. Webster's article upon the planting and managing of Larch plantations. I should say from my experience in planting that no better directions could be given. Of course, these directions apply only to the planting of Larch; other kinds require other management. Each other kind ought to have particular directions for the planting and management of it; and again, mixed plantations of two or more different kinds of trees, require special directions for each different mixture of trees. There are some kinds of trees that can only be grown profitably in a mixed plantation. I do not know if this is what Mr. Forbes means by "scientific forestry." But a truly scientific forestry is impossible at present, because the data for it are unknown. "Scientific agriculture" is to a certain extent possible, because Lawes and Liebig and Ville have taught us something about the physiology and chemistry of soils and different farm crops; but nothing of the kind has been attempted in forestry. Your Cornish correspondent is mistaken in thinking that the thinning of them by storms has anything to do with the peculiar character of natural forests. That character depends upon there being a constant succession of seedling plants of all different sizes growing together. When the larger trees are cut out, there are always smaller ones to take their places. Anyone may see this, and study it in the Pine and Fir forests of Norway and Sweden. But there is an instance in England of the similar management of a natural forest. The Beech woods in Buckinghamshire are managed by taking out and stubbing up a certain number of the largest trees every year; these are constantly replaced by seedling trees, of which, in all sizes, the woods consist. There is a piece of wood here, which fifty years ago came up a self-sown forest of Silver Fir; so that, being of all different sizes, they never required to be thinned. But the conditions of a wood artificially planted are totally different from those of a natural forest. *C. W. Strickland.*

"SAUCE AND SEWE."—In the interesting article in your paper of Saturday last on "Fifteenth Century Gardening," the writer translates the line—

"Herbys to make bothe sawce and *sewe*,"

thus:—

"Herbs to make both sauce and *show*."

I think the last word must be one which is still in use in this district, Furness, and was used in the same sense. On Good Friday, a customary dish is "Fig sew," made by boiling Figs in beer or milk. In Stormont's *Dictionary*, "sew" is given as an old English word for pottage, boiled meat, and "seaw," Anglo-Saxon, juice. *Geo. Slater, Barrow-in-Furness.*

FLORIFEROUS PLANTS OF CHRYSANTHEMUM.—The early summer varieties are now at their best in Mr. Milward's picturesque gardens. The plants include two pyramids, one having 357 the other 350 flowers on them; there are also two dwarf-trained specimens, one with 360 the other 355 flowers, so that these four plants carry 1422 flowers, a remarkable result of cultural skill on the part of Mr. J. Fleming, the gardener. *W. H. Titcomb, Alice Holt, Farnham, Surrey.*

The Week's Work.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton.*

THE CONSERVATORY.—At this season any repairs, painting, and glazing, should be carried out. If painting be not done, then washing with soap and water is almost sure to be needed, as is also the lime-washing of any walls that there may be. The first of the flowering plants to put into this house are the early-flowering Chrysanthemums, which if trained into certain shapes are useful subjects for placing as starers, filling up the remaining space with Salvias, Celosia plumosa, Lasiandra (Pleroma) macrantha, Pelargoniums, &c. Where the space at command admits of a group or groups of specimens with single stem, arrange one in the centre of the house, but this kind of arrangement is best left alone unless the roof is sufficiently high to afford these a good appearance, for nothing looks more incongruous than plants touching the roof. Such varieties as Elaine, Avalanche, Belle Jeanne, Gorgeous, Mr. Holmes, Lady Selborne, W. H. Lincolm, are useful at this season. No manurial stimulus should be given to these plants. The stakes which are seen to be too long for the stems, may be shortened or replaced with others, placing these so that they are concealed.

ZONAL PELARGONIUMS.—These form a useful and brilliant group of plants for the conservatory, and care should be taken to distribute the various colours in a harmonious manner. The double and semi-double flowered varieties are more useful in the neighbourhood of smoky towns, as the blooms stand the effects of the winter fogs better than single ones. These plants will benefit from regular supplies of weak manure-water and good ventilation, with a little heat in the pipes at the time it is afforded. Every day the floors, benches, and plants should be cleaned, and dead leaves removed; and whenever it is necessary to wash the paths and floor, it should be done in the early morning.

PRIMULA SINENSIS.—The earliest sowings will now be sufficiently well rooted to receive a weekly application of some much diluted soot-water, alternated with Standen's manure at the rate of about one teaspoonful to a 5-inch pot. A slight amount of artificial warmth should be afforded these plants, with, at the same time, abundance of air; in fact, much air should be given in mild weather.

SEASONABLE HINTS ON OPERATIONS.—The fall in the outside temperature towards the end of last week came as a reminder that frosts may soon be expected, and that the various glasshouses must be filled up with their winter occupants. The better method of arranging these plants is to place together in the same temperature, Ericas, Epacris, and Cyclamen; Carnations and Mignonette can be grown together, provided the latter be kept near the glass, preferably the roof glass. Let pots be made clean outside by washing them, and fresh green-painted sticks be given to plants where such are necessary. The first batch of Roman Hyacinths being now in a condition to be gradually forced into bloom, a portion of the stock of them may be put in a warm house, removing them to the forcing-house in about a week afterwards. Continue to use liquid manure in a much-diluted form to those Poinsettia pulcherrima whose bracts are now showing, and a higher temperature should be afforded the plants, say 65° by night, with a rise of 5° by day. Shading materials of whatever sort should be removed from the glass, except the roller blinds on the stove or other warm-houses, where they may be useful in maintaining an equable temperature during severe night frosts.

THE ORCHID HOUSES.

By W. H. White, *Orchid Grower, Burford, Dorking.*

THE HEATING APPARATUS.—It is of importance that everything connected with the apparatus which warms the various houses should be put in good working order before cold weather comes. The mild nights lately experienced in the south have rendered the use of fire-heat uncalled for in large amount, but we must now be prepared for sudden falls in the outside temperature. Immediately the houses of the warmer divisions are damped down in the afternoon, the warmth should be increased a little, so that as the temperature outside declines as the evening advances, that of the inside the houses may be easily maintained at its proper figure without having to drive the fires. By the man in charge keeping a little extra amount of heat in the pipes at night, more air may be admitted than would otherwise be prudent to afford; it is also needed in order to prevent the warmth falling too low by the morning, and by plants that are only partly through their growing season. Undoubtedly, much depends on carefully-managed night temperatures, but at times it is difficult to forecast the fluctuations in the external temperature, and I consider it preferable to err a trifle on the warmer side during the present month than run any risks. Should the houses be a degree or two too warm when finishing up for the night, no evil effects need be apprehended, providing a free use be made of the ventilators. If, however, through an inefficient heating apparatus, or owing to sharp frosts which sometimes suddenly occur during October, the temperatures of the various divisions fall a few degrees below what is considered right, no watering of the plants or damping down should be proceeded with before the required temperature is reached, and the drier the houses are then kept the better, cold and moisture being the chief causes of spot and the beginnings of disease. The following should be the night temperatures for October: East Indian-house, 65° to 70°; Cattleya and Mexican, 60° to 65°; intermediate about 60°. The higher readings should be maintained only when the external air is about 45°, when below 35° the lower ones are to be preferred, but always allowing for a fall of several degrees towards the morning. The cool or Odontoglossum-house may be kept at 50° to 55°, or warmer if the weather should continue mild, the ventilators being kept wide open; but in the event of cold weather, fire-heat may have to be used, but the warmth should not exceed the lower reading. In all collections of Orchids, the destruction of insects which injure the plants in one way or another is constantly

called for, if the plants are to be kept in health. I have frequently advised Orchid cultivators to be careful in the use of chemical insecticides; at the same time, I have largely experimented with them, and found that one of the best, most efficacious, and safest insecticides is the XL All vaporising fumigator. During the past summer I have used nothing else, and the Orchids are cleaner than they ever were before; in fact, as regards thrip, none is visible. I may add, that with the exception of Disas (the foliage of which is exceedingly tender), every species of Orchid here has been exposed to the vapour periodically, without the slightest injury being done to a single plant.

FRUITS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

CHERRY TREES.—The trees intended for forcing early being at rest, the repotting of those which require it should be done. Always use perfectly clean pots, abundance of drainage, and a potting soil consisting of turfy loam mixed with one-eighth mortar-rubble broken moderately small, and some half-inch bones. Pot firmly, leaving ample space for water. For top-dressing use two-thirds loam, and one third manure. Every pot should be turned out, and the drainage materials put into good order. If planted out, fresh soil, more or less in quantity, according to the needs of the trees and age of the border, should be afforded, and any trees or bushes that are growing grossly carefully dug up and replanted. Any pruning still remaining to be done ought now to be attended to. Good varieties of Cherries for forcing are May Duke, Royal Duke, Black Circassian, Black Eagle, Knight's Early Black, Bigarreau Napoleon.

THE FORMATION AND MANAGEMENT OF VINE BORDERS.—The season has arrived when the making of new borders or renovation of old ones may be best undertaken. Having determined on the width and depth of the border, having regard to the size and elevation of the vinery, 15 feet being allowed for lean-to houses as the width of the border if it be intended for early forcing, and proportionately more for span-roofed vineries, and those intended for late Grapes. It is desirable to make the interior of the house a border, with free access for the roots to both borders; in fact, the land must be treated as a whole merely divided by a row of pillars supporting the front of the house. Some cultivators prefer to have the earliest Vines in an inside border, so as to have them quite under control. For a span-roofed vinery, 25 feet in width should be allowed, in addition to an inside border about 12 feet wide on each side; but no fixed rule can be given, and the gardener must be guided by circumstances. The depth of drains will be settled by the natural drainage of the ground, but on soils that are retentive, the staple should be taken out to the depth of 5 feet, measuring from the top of the pillars or arches of the vinery and where the soil of the border will be required to stand when finished. A slope of 1 inch to a foot should be given to the bottom of the border; a 9-inch brick wall should be built round the front to keep the roots from going into the soil beyond; then a layer of concrete, 4 inches thick, should be placed over the bottom of the border. A main drain should run along the front or end of the border, 8 inches below the level of the concrete, and this may be connected with the outfall drains of the garden. On the concrete place lines of drain-pipes 3 inches in diameter, about 6 feet apart, and connect these by means of pipes with the main drains. Over the drain pipes and concrete, place a covering of chalk, brickbats, or coarse gravel to the depth of 12 inches, then a thin layer of charcoal and turf. Where limestone or chalk underlie the border, there will be no occasion to drain to this extent so long as a good outfall drain is provided. The bulk of the border may consist of good turfy friable loam, lime rubbish, charcoal, and half-inch bones; the turf being taken from old pasture land if possible, and it should not be too strong or contain much clay, neither should it be sandy. The more of the fibrous roots of plants that it contains the longer it will last before getting pasty or soured. It should be dug in sods 6 inches thick, carted, and placed in the Vine-borders at once, or stacked in a convenient place. There is no necessity to chop it up; it is quite as good carted at once to the border, and placed the grassy side downwards, with 2 inches of porous material between each layer of sods, to keep the soil open. This last is a main point in Vine-border making, as after a few years many kinds of soil run together into a retentive mass, causing shanking of the berries and other evils, which are due to the loss of the young roots in the winter. The usual plan of making Vine-borders is to chop up the loam, and to every five cartloads add one of lime-rubbish, broken bricks, and charcoal, with 1 cwt. of ½-inch bones, mixing all well together. By my method there is a saving of time and labour, and the borders are more evenly and firmly made. The depth of the borders will allow for more drainage and more rough materials being used than is usual in making Vine-borders. Here at this place, twenty years ago, this plan was adopted, and it has answered well; the rough materials were placed in alternate courses —charcoal, turf, the grass-side down; ½-inch bones, turf, lime-rubbish, and so on, to within 9 inches of the top of the border, which consisted of loam and bone-meal. No manure of a quick decomposing nature was used; it is too stimulating, causing strong, long-jointed wood which often ripens badly, and the soil, when much of it is used, quickly settles into an uneven close mass unsuitable for the production of good short-jointed wood, and fine clusters of Grapes. The piecemeal system of making borders is the best; the inside border being made the first year, leaving the outside to be done as soon as the roots need more space. In three or four years the rest of the border may be divided, and half of it left for a future time with advantage to the Vines. The depth given for the borders will be objected to by some people, but it is not a bit too deep for the production of good heavy crops of Grapes for a number of years, especially when the borders are confined to a space of 20 feet, provided plenty of rough lime-rubbish, charcoal, &c., are used to keep the soil open. Shallow borders are satisfactory for a few years, but it is prudent to allow them as much width as possible for root extension where they have not to be prevented from getting into the surrounding soil.

THE KITCHEN GARDEN.

By Arthur Coombes, *Gardener, Himley Hall, Dudley.*

CABBAGES.—The plants of the second sowing having grown to a good size, they should be planted out forthwith, water being afforded them if the soil be dry, and the seed-bed should also have a watering before any plants are taken out of it. The best results are often obtained from this second sowing, the plants being less liable to bolt after a severe winter. Where plants of the first sowing have been pricked out into reserve beds, they should without delay be planted out in the open quarter. All such plants, of whatever kind, should be lifted with a trowel, it being necessary, if the effects of pricking out be not quite undone, to have a good ball of soil, and this obliges the use of a trowel in planting them. If the Cabbage-maggot or grub is feared, any plants observed to be failing in any way should be taken up and burnt, thus making sure of killing the grub or maggot, the gap being filled up from the reserve. As a precaution, dip the roots of all Cabbages in a puddle made of clay, soot, and water, on planting them. Red Cabbage should now be planted at 3 feet asunder in good soil, in a perfectly open place, but not just close to the paths.

LATE POTATOS.—The slight frosts having put a stop to growth, the tubers are now ready for being lifted, and in a dry state of the soil may be dug up and stored in clamps or dark cool cellars.

GLOBE ARTICHOKES.—Owing to the want of any great heat to cause complete maturity, these plants are producing heads unusually late, and any of these still fit for use may be cut off and the ends of the stalks put into a pan of water. Remove the old stems, and dress the plants with rotten manure, forking it in between the plants.

MUSHROOMS. — Ridges may be made out of doors if the materials are sufficient in bulk, and litter and waterproof coverings to put over them are available. The chief point is to have prepared stable-dung in quantity to make ridges 4 feet wide at bottom and 3 feet high, a loamy adhesive soil for covering the bed, a steady warmth of not more than 90° at 1 foot below the surface, and good spawn.

SCARLET RUNNER BEANS.—Although we have had in this district 5° of frost, Beans are not injured; but it will be well to keep the pods closely gathered and stored in a damp cellar.

THE FLOWER GARDEN.

By John Lambert, *Gardener, Powis Castle, Welshpool.*

CARNATIONS AND PICOTEES.—These, if layered as advised, will now be rooted, and ready for being transplanted, which work should be performed forthwith, and with rapidity, so that the young tender roots are not long exposed to a drying atmosphere. Where a fresh border is obtainable, and it is always best to give these plants a change of soil, it should be in or near to the flower-garden, if that be possible. In my own case, I have grown them for several years in succession on the same ground, it being the most suitable place that there is in the garden. It is a south border, about 10 feet wide, with a Peach wall at the back of 9 feet in height. In commencing the job, detach the layers from the parent plant by cutting through the stems with a keen knife; then sort out the best-rooted and strongest for planting, cleaning off nearly all the soil in which they were layered, if it be not of the best quality; laying these carefully in some soil near at hand, the weaker layers being laid in for future use. Then afford the border to be planted a light dressing of good loam, and a dusting of soot and charred garden refuse. If the soil be too heavy, horse-droppings will improve it, but partly rotten cow-manure will be more suitable where the soil is light. Dig the ground well, breaking it up fairly fine; if too wet and stiff, let it lie untouched for a day or two. Then apply another light dressing on the top, of the same materials as before, and prick this lightly and evenly in all over the border, when, if dry enough, planting may be proceeded with. Great care must be given in planting, the young roots being very tender, and the little ball of soil adhering to each quite loose. If in beds, they may be planted a little closer, but when in long lines, and no alleys are left between them, 15 inches from plant to plant will not be found too much at layering-time, if the plants are strong. Plants late layered will not require quite so much space. After planting, afford one good watering, and should fine dry days come, a sprinkling of tepid water, by means of the syringe, will be of benefit to them. A few of the best of each variety left over from planting may be potted-up in case of failure, and plunged in coal-ashes in a cold frame, close to the glass. This plan may be advisable for all the plants in very wet, stiff clayey soils, but I do not advise leaving the layers attached to the old plants throughout the winter, and planting them out in the spring; for having tried a few this way, I find the heavy rains are apt to wash the light loose soil from the roots, exposing them; the frost also lifts them, and has more effect on them this way than when properly planted.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

ROOT-PRUNING APRICOT TREES.—Trees of very vigorous growth will be benefited by being root-pruned during the present season; and trees planted two years, which also make shoots of great vigour, are beneficially checked by being lifted and replanted. In the case of fruiters, the earlier this work is undertaken the less risk there will be of injuring the fruit crop of next year. Where the space at command admits of borders 6 feet wide being devoted to Apricots, and this area can be confined by means of a chalk or other wall, which I have described in a previous calendar, then the roots being quite under the control of the cultivator, short-jointed fruitful shoots can be assured, and the dying off of the branches, so common in vigorous trees, greatly reduced. If the trees are growing in borders about 12 feet wide, cropped with vegetables, arrangements should be made to have the borders fallow at this season, so that the root-pruning of the trees may be properly attended to. As in most gardens the Apricot border is only 4 feet wide, the roots should be pruned back to that point. In place of the usual heavy dressing of manure for the vegetable crops, a good quantity of turfy loam, burned garden-refuse, old mortar, chalk, &c., may be worked into the soil of the border, the vegetable crops being made of secondary importance. This is better than using manure, which only encourages strong growth in the trees, with the consequent labour of root-pruning.

LIFTING AND REPLANTING PEACH TREES.—As with the Apricot so also with these fruit trees. Young or gross-growing trees should receive early attention in the matter of lifting and replanting, or else in such a season as the present, with the ground thoroughly moist, the trees will continue to grow till the frost causes the fall of the leaf. The rains have rendered the soil in the best possible state for replanting, which operation may be done without delay, if the trees are kept syringed every day so long as the weather is dry and the leaves remain on them. A large wheelbarrow-load of old mortar and wood-ashes in about equal parts, well mixed together with the staple, should be applied to each tree station. If the weather should keep dry, a mulching of spent Mushroom-bed manure should be laid over the roots of all disturbed trees, otherwise mulching may be deferred till frost threatens.

**

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY	Oct. 9	Royal Horticultural Society's Committees at the Drill Hall, James Street, Westminster. United Horticultural Benefit and Provident Society's Anniversary Dinner at Cannon Street Hotel.
WEDNESDAY	Oct. 10	—East Anglian Horticultural Club.

SHOW.

WEDNESDAY	Oct. 10	National Chrysanthemum Society at the Royal Aquarium (three days).

SALES.

MONDAY,	Oct. 8	Plants, Roses, Ferns, &c., at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY,	Oct. 9	Greenhouse Plants, at Prospect House, Woodford Green, by Protheroe & Morris. Dutch Bulbs, at Protheroe & Morris' Rooms. Nursery Stock, at the Wood Lane Nurseries, Isleworth, by order of Messrs. C. Lee & Son, by Protheroe & Morris. Nursery Stock, at the Nurseries, Tunbridge Wells, by order of Messrs. T. Cripps & Sons, by Protheroe & Morris (three days).
WEDNESDAY,	Oct. 10	Dutch Bulbs, at Protheroe & Morris' Rooms. Special Sale of Hollies, Rhododendrons, &c., at The Nurseries, High Beech, by order of Messrs. Paul & Son, by Protheroe & Morris.
THURSDAY,	Oct. 11	Dutch Bulbs, at Protheroe & Morris' Rooms. Plants, Roses, Ferns, &c., at Protheroe & Morris' Rooms. Orchids, at The Gardens, Walton, Stone, Staffs, by Protheroe & Morris.
FRIDAY,	Oct. 12	Orchids, at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe and Morris' Rooms.
SATURDAY,	Oct. 13	Orchids, at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—52°.2.

The Great Fruit Show.

The great Fruit Show inaugurated by the Royal Horticultural Society, has come and gone. It can hardly be compared to some other displays of a similar character; but taking the time, the season, and all other circumstances into account, it must be pronounced to have been a good show. The weather was bright and altogether favourable, thus forming a marked contrast to the state of affairs at Chiswick on the previous Tuesday. There was, moreover, a large gathering of gardeners, for whom a fruit show seems to have greater attractions than any other horticultural exhibition. On each day the Conference Hall was crowded, so much so, that on the third day a larger hall had to be utilised, showing the interest that is excited by the subject of fruit culture. The papers were sensible and to the point, and whilst they did not hold out exaggerated notions of the profit to be derived from fruit-culture, they, at least, showed that under fairly favourable conditions, the industry could be, and was, worked at a profit.

It might have been supposed that the public had experienced a surfeit of fruit, its culture, and exhibitions, but judging by the number of exhibits and exhibitors, and the good attendance of sightseers on the first day, interest in these subjects has not in any degree grown less. In contradiction to the prophecies and the lamentations of newspaper writers, and of speakers at public meetings, we are still *facile principes* in Apple and in Grape culture, and as far as climate permits, we are not so very greatly behind our neighbours. In the matter of small fruits, Cherries, and Pine-apples, we cannot be said to occupy a mean position. We still cultivate too many varieties, we have much to learn of the arts of packing, assorting, and marketing, and we are slow to appreciate the use of insecticides and fungicides, for the purpose of saving much of the fruit now lost.

Fruit drying, in view of the burdensome railway rates now charged for all but those goods sent in quantities of a ton, is deserving of the earnest attention of cultivators, seeing the general excellence, marketable portability, and relative cheapness of the various products shown by home exhibits. These, so far as could be judged without tasting the examples shown, are the equals of anything that we, at the present time, import from France, Spain, California, Australia, and Germany. We need not specify here what these were, as a notice of them will be found in another place.

Of hardy fruits grown out-of-doors, it may be said that the colour was much better than might have been expected after this somewhat sunless season. Naturally a higher colour is looked for in fruits under glass, but this is not always the case, and this year at least, ripe or ripening fruits from cordons grown under glass are not nearly so rich and bright in their tints as out-of-door grown ones—if we may except Peaches, such as Lady Palmerston.

We do not look for blemished appearance in the picked fruits of an exhibition, so that we are unable to say if it be a fact that much fruit has this season suffered from those minute funguses which attack the rind of Apples, Pears, and Plums. The dishes of Apples were present in bewildering numbers. The trade exhibits were extensive (we rather wish they were less so, for they are a great temptation to would-be buyers of trees). The collections of fruit were not up to the mark; nor were the Grapes as fine as have been seen at former shows at Sydenham, or of phenomenal size of bunch.

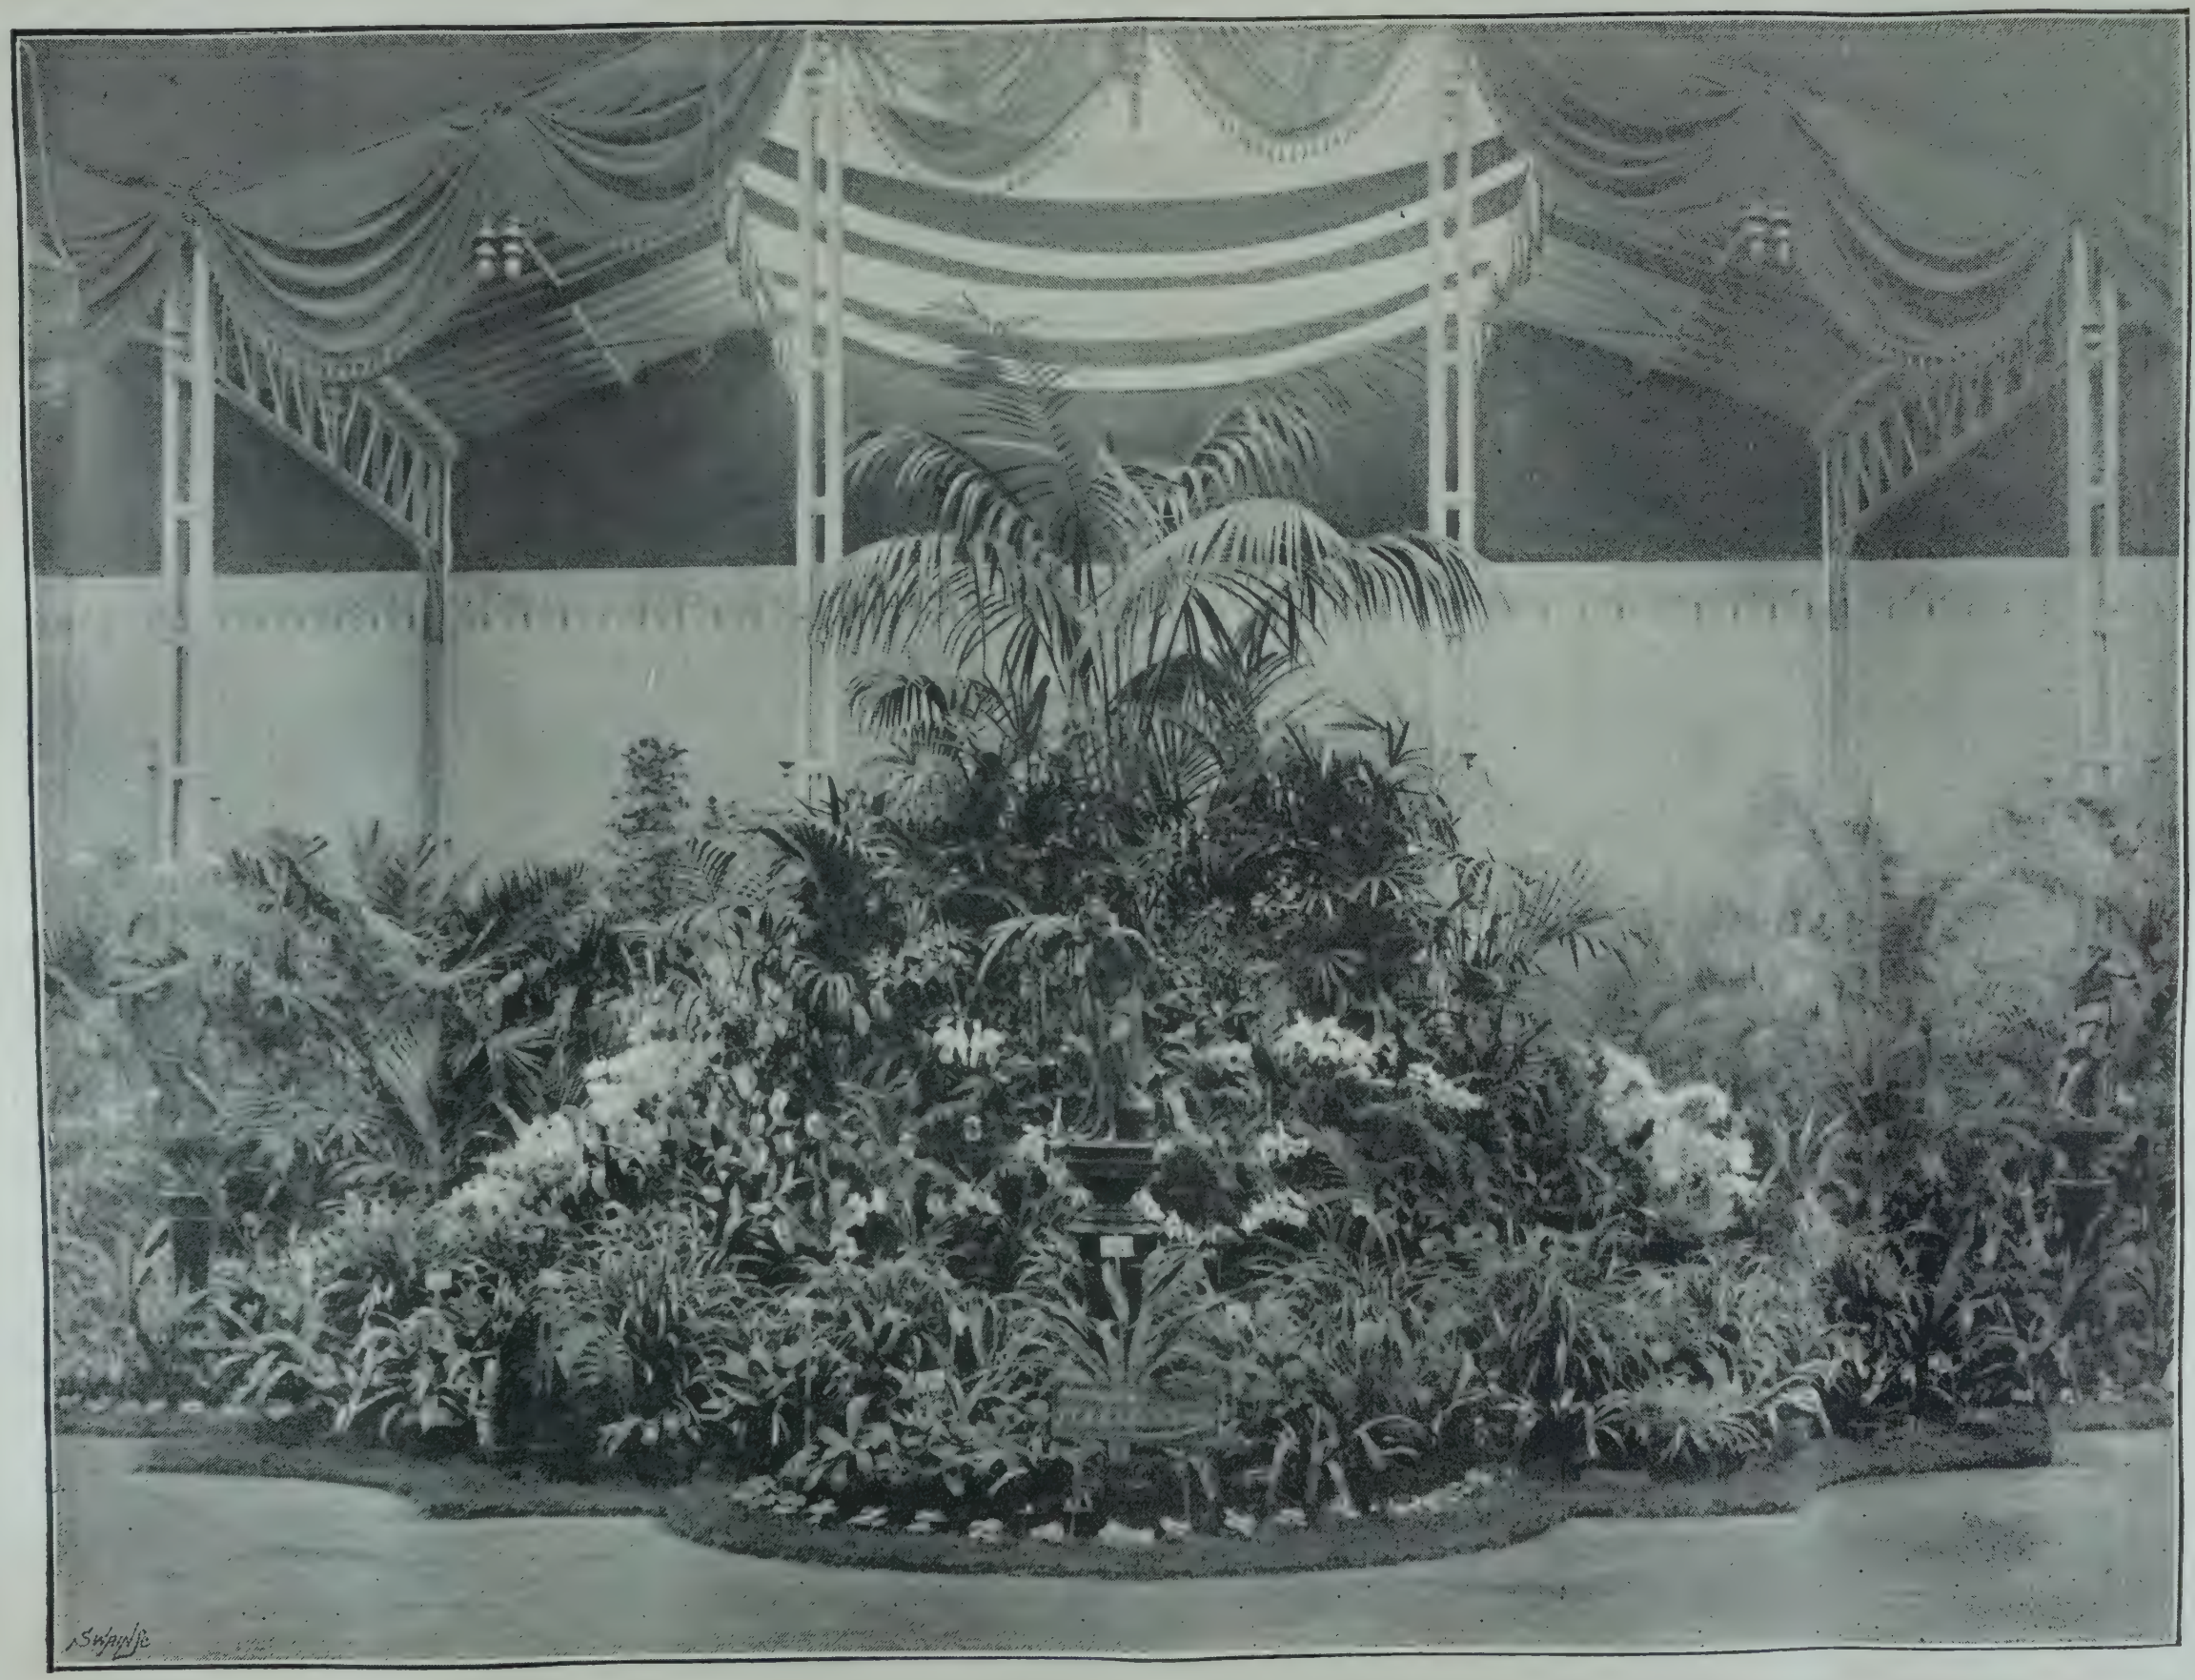
We were pleased to remark a novel, very practical, lasting, and what is more, a cheap kind of basket made of wood. It is made in bushel and half-bushel sizes, and a number of them may be put one in the other like a lot of tumblers, thus occupy but small space as empties, compared with that taken up by the old-fashioned baskets. Moreover, they have lids with open slats, so as to admit of the escape of moisture, and being smooth at the sides, fruit, &c., cannot readily be bruised.

As a place for a show of this kind, the Crystal Palace is unrivalled, and many who were present echoed the wish that was expressed by one of the speakers at the luncheon, that in future the Royal Horticultural Society will occasionally hold some of its large shows in so very suitable a building. Even if the weather were wet the spectators would not have to experience the discomforts which were felt at Chiswick at the Tree and Shrub Conference.

We refer to another column for a detailed report of the Show and of the Conference; but we may here allude to a very praiseworthy attempt to break away from the traditional rows of white plates which was made by Mr. Owen Thomas, and one or two other exhibitors. By command of Her Majesty a large collection of fruit was exhibited from the Royal Gardens. It comprised some 120 varieties of Apples, 110 varieties of Pears, 14 Pines, Peaches, Frogmore Selected Tomatos, Grapes from the famous Vines at Cumberland Lodge and Hampton Court. The former, a veteran of 110 years, is this year bearing about 2000 bunches of Grapes. We hope, in a subsequent issue, to give an illustration of this group.

Mr. Thomas arranged his vast mass of fruit in the form of a trophy, which was effective, and showed what might be done in the future in this way. It showed also that by a little contrivance it would be quite as easy to display the fruit for comparison or in competition in this way as in the ordinary manner. There is really no reason why some at least of the best flowers and the best fruits should not be arranged in masses to please the eye. Why should the most beautiful objects in creation suffer by being arranged in the ugliest and most formal manner possible? Something has been done to vary the monotonous lines of Dahlias; and even Rosarians are beginning to see that they do dishonour to the queen they worship by allowing her to be displayed in the most unattractive way possible. Fruit, as the nearest greengrocer's stall will prove, is capable of being grouped in such a way as to display its pleasing forms and rich coloration to the best advantage. The Spartan simplicity of rectangular boards, green boxes, paper collars, blacking bottles, and bare white plates, &c., may be left for committee meetings and gatherings of experts, but at shows to which the public is admitted every endeavour should be made to gratify, instruct, and interest them.

To show what our Belgian friends do on similar occasions, we give this week an illustration (see Supplement) of the central group in the "Salon Royal" of the International Horticultural Exhibition at Antwerp in July last, and mentioned in our issue for July 28, p. 96. It was arranged by M. Guillaume de Bosschère, and the photograph, one of a series of beautiful views, was executed by M. Albéric Lunden.



Royal Horticultural Society.—The next meeting of the above Society will be held in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, October 9, when a large display of fruits and flowers is anticipated. At 3 o'clock Mr. E. H. Woodall, F.R.H.S., of Scarborough, will deliver a lecture on "How to Popularise Orchid Growing."

"The Kew Bulletin."—The September number (No. 93) contains an interesting article on the "Vegetable Resources of India," comprising a summary of a report prepared by Dr. Watt; a list of the plants collected in the Hadramaut Valley, Arabia, by Mr. W. Lunt, one of the Kew Garden staff, who accompanied Mr. Bent's expedition, is also given. Mr. Lunt brought home about 150 species, including representatives of twenty-five new species and two new genera. The ninth decade of new plants is published, consisting of specimens in the herbarium previously undescribed.

Lindley Library.—The following sums have already been promised or paid towards the Library Fund and the preparation of a printed catalogue. At present the amount received is very inadequate for the purpose:—

Dutch Horticultural and Botanical Society: Floral Committee.—Meeting of September 8, 1894. The committee awarded:—First-class Certificates to Messrs. E. H. Krelage & Son, of Haarlem, for Cactus Dahlias Mrs. John Arnold, Rayon d'Or, Mrs. Thornton, and Veilchen; single Dahlias Miss Gordon, Flora Fischer, Mikado, and Elegance;

Central Group in the Royal Saloon, Antwerp Exhibition, July, 1894.

Lilliput Dahlias Lilian and Marion; Show Dahlias Grand Sultan and Herzog von Kostritz; to Messrs. Ter Brake & Co., of Bussum, for Begonia tuberosa with yellow flowers; to Messrs. Groenewegen & Co., of Amsterdam, for single-flowered Dahlias Madame J. Closon and Souvenir de Madame Schrelle, Lobelia erinalis rosea; to Messrs. A. Glym De Vos & Co., of Utrecht, for Aglaonema costatum, Adiantum macrophyllum albo-striatum, Lastrea lepida, Pteris ludens, Tropæolum Lobbianum fol. var.; to Mr. J. Th. Van Den Berg, Jun., of Jutfaas, for Begonia tuberosa var. campanulatus; to Mr. J. W. Daudey, of Haarlem, for Cactus Dahlias Lady Penzance and Ernest Glasse. Awards of Merit to Messrs. E. H. Krelage & Son, of Haarlem, for Antholyza paniculata; to Messrs. Ter Brake & Co., of Bussum, for Gloxinia hybr. fol. varieg.; to Messrs. A. Glym de Vos & Co., of Utrecht, for Pteris serrulata gracilis, P. s. nobilis variegata, P. tremula densa, P. aspera multifida; to Mr. F. Van den Wissel, of Epe, for Chamæcyparis pisifera plumosa variegata aurea. An Honorable Mention to Mr. Van Dam, Jun., of Utrecht, for a collection of Begonia tuberosa var. fl. striata.

Chrysanthemums in the London Parks.—We are requested to inform our readers that the show of Chrysanthemums at Southwark Park will be opened to the public on the 6th inst., and may be viewed from 10 A.M. till 4 P.M. every day. The flowering of the Chrysanthemum is much earlier this year than usual, and there is a prospect of a splendid display, many being already in full bloom. The number of flowering plants, including all novelties, is 4000. The house will be utilised, if possible, after the show is over, as a winter garden. —The annual show of Chrysanthemums at Waterlow Park, Highgate Hill, will be opened to the public on Saturday, October 13, from 10 A.M. until dusk, Sundays included.

Hyacinths and Lilies of the Valley Flowering early in September.—In former years the first forced Hyacinths in Berlin were ready in October. They were the White Roman varieties. This year the first forced Hyacinths appeared at the beginning of September. They were of various sorts, but not White Roman. The flowers were white, blue, and rose-coloured, the inflorescences healthy, though somewhat short. I hear that the bulbs were kept in an ice cellar during the spring and summer, and then forced at a very late date. Flowering Lilies of the Valley in September are not new to me. Some years ago I saw good specimens of this at Eberswalde near Berlin; also last year at the great exhibition at Leipzig. I remember that some ten years ago at St. Petersburg the well-known nurseryman, Mr. Eilers had flowering Lilies of the Valley ready on the birthday of the Russian Empress in August. These Lilies of the Valley differ very much from those forced during the winter. The flowers are of a very firm texture, the leaves of that bluish-green colour, seen only in those plants which grow in the open air, whilst plants forced in winter, especially the earliest ones, have only small flowers and yellowish-green leaves. It is a question whether it would be possible and lucrative to grow these plants in the future in the same way, so that we might have Hyacinths and Lilies of the Valley all the year round. I hear that a great many of the bulbs and roots die in the ice cellar. Perhaps it would be possible by careful selection to raise varieties which would not suffer by this management and treatment.

The Torquay District Gardeners' Association.—This Association, which is in the third year of its existence, is congratulated in the second annual report of the Committee upon the continued success which has attended its proceedings. The first annual outing took place on August 10, 1893, when a large number of members visited Taunton on the occasion of the flower show. The first ordinary meeting of the Session 1893-94 was held on Friday, October 6, when, in place of the President (Mr. Lavers, since dead), Major Grahame read an interesting paper on "Nature's Agencies in Seed Dispersion." The financial position, as revealed in the balance-sheet, shows a sum of more than £14 to its favour. The present President of the Association is Dr. R. Hamilton Ramsay.

Middlesex Technical Education.—The Tottenham district has instituted for the coming winter, classes in cookery, dressmaking, home-nursing, principles of horticulture, plumbing, hygiene, and carpentry. The horticultural class is conducted by Professor Boulger, on Tuesday evenings at 8 to 9 P.M., at Bruce Castle. Admission is free.

Sale of Nursery Stock at Aberdeen.—The well-known firm of Messrs. Wm. Smith & Sons, seedsmen and nurserymen, Aberdeen, in consequence of removing from their nurseries at Polmuir, to Burnside, Stocket, near Aberdeen, disposed during the last four days of the past week, of their whole nursery stock and greenhouse plants by public auction. The magnitude of the sale drew together a very large and representative number of buyers from all quarters. The bidding on the first day was rather spiritless, but on the second and third days nurserymen and gentlemen's gardeners put in an appearance in larger numbers, and the demand became more animated, more especially on the third day, when the whole of the pot plants, numbering about 4000, were disposed of. For Roses there was a capital demand. The sale at first was meant to extend only over three days, but the salesman was unable to overtake the work in that time, and a fourth day had to be resorted to. In all over 3000 lots were sold, and not a single lot was withdrawn if money was offered for it. Mr. Farquhar, auctioneer, Old Echt (assisted by Mr. Fyfe, Netherhills), was entrusted with the conducting of the sale, and also acted as judge at the close of the fourth day's proceedings.

Mr. George Ross, who has been gardener to Mr. McHardy, of Cranford, Aberdeen, for the past fourteen years, was, the other evening, on the occasion of his leaving for a situation with Captain J. G. Baird Hay, Belton, Haddingtonshire, made the recipient of a handsome marble clock and a couple of bronze statuettes by his professional brethren. The chair was occupied by Mr. Alex. Robson, Vice-chairman of the Royal Horticultural Society of Aberdeen.

Ealing Gardeners' Association.—The opening meeting of this flourishing Institution, which has a membership of nearly one hundred, took place on the 2nd inst., when an interesting paper was read by Mr. J. Barry, Chiswick, entitled "Some Thoughts by the Way on Gardening and Gardeners." J. Sewell, Esq., occupied the chair. Local interest attached to the references to Lee's firm (who have a branch for Roses and fruit trees at Ealing), on its being pointed out that Lee of Hammersmith introduced the first standard Roses into this country from France in 1818, it being on record that the then Duke of Clarence gave the firm an order for 1000 trees at a guinea each! The Lees', too, introduced the Damask Rose, and were among the first who obtained the medals of the Horticultural Society at their once famous shows at Chiswick, and at the monthly meetings, which in those days were held in Regent Street. Roses were at that time shown singly upon the bright surface of japanned tin cases, in which bottles filled with water were inserted, the dimensions of the case being 30 inches by 18. Suggestions were made as to the better and more effective arrangement of Rose shows than now prevails. An interesting section was devoted to the wealth of hardy trees and shrubs, and particularly of exotic species, distinguished by the beauty of the autumnal foliage, passing reference being made to the rich stores of such subjects at the Royal Gardens, Kew, and at Syon. Examples of successful associations of this class of plants at Messrs. Veitch's, Coombe Wood, were referred to. Gardening retrospective and prospective formed the subject of some interesting and practical references, a note of warning being sounded to young gardeners for their apparent preference for employment in the houses, to the entire exclusion of the more important departments of the kitchen and hardy fruit and flower-garden and pleasure-grounds. Gardeners' wages, examinations, and outings, also formed subjects of reference. Gardening charities, too, were touched upon, and hints thrown out for adding to the exchequer of the Gardeners' Orphan Fund, the suggestions being that such might be augmented were collections made at "harvest festivals," "flower-sermons," spare balances (as a result of flower shows) from flourishing horticultural societies, and a recommendation that successful exhibitors at the various flower shows throughout the United Kingdom might exercise a little self-denial annually, and forward a modicum of their winnings to the fund, which would doubtless (if the idea were acted upon) result in a substantial sum to this deserving charity. Why should not the gardeners of the United Kingdom be in the proud position of being able to place on the fund yearly some "winners' children?" Regret was expressed that at the "head-quarters" of the Fund—Chiswick—the annual, and always good concert, which was always well supported, and produced yearly quite, if not more, than £20, had been abandoned. A better example should be set by the gardeners at Chiswick and the surrounding districts, as the concert idea first started there.

Large Pumpkins.—*Apropos* of the Pumpkin weighing 196 lb. exhibited last week before the Royal Horticultural Society at Chiswick by Mr. Basill, Woburn Park, Weybridge, it may be interesting to remark that in *Loudon's Magazine*, October 21, 1834, it is recorded that one grown by Lord Rodney weighed 212 lb., and measured 8 ft. in circumference; whilst notice is made in the *Gardeners' Chronicle* for October 12, 1861, of one in a market garden at Orleans that weighed 242½ lb., and was 10 feet 4 inches in girth. Excepting these two cases, the one shown at Chiswick appears to be the heaviest of which we have particulars.

Trinidad.—Mr. William Lunt, of Kew, has been appointed assistant superintendent of the Royal Botanic Gardens, Trinidad.

Professor Greene.—The important part which the Californian flora has played in the supply of plants to the gardens of Europe, and the fact that a fresh attempt is now being made to introduce other plants of that country into cultivation there by exchange with the Botanic Garden of the University of California, induces us to mention that Professor Greene is now studying at Kew, England. In the herbaria there and at the British Museum perhaps two months' time will be spent. Later it is expected that the greater continental herbaria, at Paris, Berlin, and Geneva will be visited.

Mr. G. E. Blenkins.—The death of this gentleman, a Deputy Inspector-General of Hospitals, is announced. He was Surgeon to the Grenadier Guards during the Crimean campaign. Garden readers will be more likely to remember him as a member of the Fruit Committee some twenty years back.

Scarlet Runners and Canadian Wonder Beans.—These two varieties have already been harvested in Germany in first-rate condition. But in England and Holland, the prospects for seeding are most unfavourable; and, unless we soon get dry and sunny weather, the new crop must necessarily be a bad one. As it is, growers from different parts of the country reported at the beginning of last week that their crop did not look nearly so well as it did a fortnight earlier. And if we take into consideration, the new season will commence with scarcely any old stocks, it is obvious that the demand for seed will be a strong one.

The Yorkshire College, Leeds.—This College, which is connected with the Victoria University, has issued its third report on the work of the Agricultural Department. The lectures on "The Principles of Horticulture, Fruit Culture, and the Management of Allotments," by Dr. Clark, appear to have attracted much attention. The same gentleman held classes for teachers. The systematic course intended for those who wish to obtain a thorough practical and scientific training in

agriculture and the cognate sciences, extends over two years. This general awakening to the importance of obtaining information is a very satisfactory result of the Technical Education scheme.

Fruit to Japan and China.—We learn on the authority of the *Melbourne Leader*, that considerable success has attended the shipment of fresh Prunes, Plums, Pears, and Apples from Washington to Chinese and Japanese ports. The fruit is carefully gathered and packed, is carried in the refrigerating rooms of the steamers, and uniformly reaches its destination in good shape, and is sold for remunerative prices. Indeed, the domain of experiment in this direction has long since passed, and the commencement of what may develop into a great business has been made.

Bengalis as Nurserymen and Florists.—Floriculture, says our contemporary, *Times of India*, August 17, 1894, is a pursuit for which a class of educated Bengalis appear to have taken a special liking. The nurseries in and about Calcutta are growing in number, and some of them show every sign of prosperity. The proprietors of some of these establishments are men of enterprise, and evince energy and pluck not common in the average Bengali.

THE DAHLIA GRAND DUKE ALEXIS OF RUSSIA.

Our figure represents a convolute form of Dahlia recently exhibited by Messrs. Cannell, to whom we are indebted for permission to illustrate it (fig. 54). The peculiarity consists in the manner in which the edges of the florets are rolled round one another. The specimens exhibited were large forms of the show Dahlia type, and interesting from their novelty. The colour of the variety is white, tipped with delicate lilac.

SOCIETIES.

ROYAL HORTICULTURAL.

Great Exhibition of British-grown Fruit at the Crystal Palace.

September 29, *and October* 1 *and* 2.

Fruits Grown under Glass or Otherwise. (Open to All.)

Collections of Fifteen Distinct Dishes of Ripe Fruits (*Open*).—The greater part of the interest attaching to almost all the classes was lacking in that for the large collection of fruit in the open division. It was arranged for a collection of ripe fruits, to consist of fifteen distinct varieties, and to include two varieties of Melons, and a dish of each of the following:—Black and White Grapes, White or Yellow Plums, Red or Black Plums, Peaches, Nectarines, Apples, Pears, and five other dishes of other kinds of fruit, or of distinct varieties. The only competitor was Sir Jos. W. Pease, Hutton Hall, Guisborough, Yorks (gr., Mr. J. McIndoe), who was deservedly awarded the 1st prize of £10. He had three bunches of Gros Colmar Grapes, with grand berries, with fair but not exceptional colour; three very large bunches of Foster's Seedling, well-coloured; fairly good Exquisite Peaches, good Washington Apples, Pond's Seedling and Magnum Bonum Plums (good), Humboldt Nectarines, Pitmaston Duchess Pears, Moor Park Apricots, Warrington Gooseberries, Brown Turkey Figs, two Melons, bunch of Bananas, and a dish of Passion-fruit (Passiflora edulis).

The second class was better contested, there being three exhibitors of a collection of ripe fruit of nine distinct varieties (Pines excluded), to include two dishes of Grapes (distinct), one Melon, one dish each of Pears, Apples, Peaches and Nectarines, and two other dishes of other kinds, or of distinct varieties. Exhibitors were allowed to show in one of the two first classes only.

The 1st prize was won by the Countess of Camperdown, Weston House, Shipston-on-Stour, Worcestershire (gr., Mr. Jno. Masterson). The exhibit included Black Alicante Grapes (good), Muscat of Alexandria Grapes of fair quality, but the bunches might have been handsomer. King of the Pippins Apple, Beurré d'Amanlis Pear, Barrington Peaches, Pine-apple Nectarines, Morello Cherries, and Brown Turkey Figs, all of satisfactory quality. The second position was taken by the Hon. D. P. Bouverie, Coleshill House, Highworth (gr., Mr. S. Haines). He had Black Alicante Grapes of fine colour, as were also the Gros Maroc, though the latter were rather small, and the bloom much rubbed. Pine-apple Nectarines were small, but well-coloured fruits; Prince of Wales Peach, Brown Turkey Figs, Countess Melon, Pitmaston Duchess Pear, and Coe's Golden Drop Plum, were all of good quality. Mrs. Wingfield, Ampthill House, Ampthill, Beds (gr., Mr. W. J. Empson), was a fairly good 3rd.

Grapes.

In most of the Grape classes the exhibitors were more numerous, and the general quality, though good, was not better or even so good as we have seen staged before. However, there were exhibits that must be excepted from this statement, and such an one was the first prize collection of twelve bunches of Grapes, in six varieties, which exhibit, perhaps, has never been surpassed—at any rate, in the size of the berries of several varieties. It was staged by J. Thompson Paton, Esq., Norwood, Alloa, Scotland (gr., Mr. Alex. Kirk). The most handsome berries were those of Madresfield Court and Duke of Buccleuch, more especially the latter, which were truly wonderful, and caused very general remark at the show. One of the bunches of Madresfield Court was a handsome one, the other not so good, but the berries in each were splendid. Muscat of Alexandria were also good in all respects, and Gros Maroc had unusually fine berries in size and colour. There were capital bunches of Mrs. Pearson also, and Black Hamburghs were noteworthy for so advanced a season. The whole exhibit was one that reflected the very highest credit upon the cultivator. The 2nd prize in this class was secured by C. Bayer, Esq., Tewkesbury Lodge, Forest Hill (gr., Mr. J. Berry). In this collection there were two large bunches of Trebbiano, and Alicante were good, and especially one of the bunches. Muscat of Alexandria was good, but they might have carried a little more finish. Gros Maroc good, but not finished quite up to the shank. Buckland Sweetwater was good and well finished, but a little past its best, perhaps; and Madresfield Court was well up to the average. Sir Jos. W. Pease was 3rd; he had Gros Guillaume, Gros Maroc, Buckland's Sweetwater, Gros Colmar, Alnwick Seedling, and Muscat of Alexandria.

Three distinct varieties, two bunches of each.—There were four exhibits in this class, and the principal prize was won by Messrs. de Rothschild, Gunnersbury Park, Acton, London, W. (gr., Mr. Geo. Reynolds). The bunches of Black Alicante were of good size, and pretty, with well-coloured berries of medium size. The Muscats carried a wonderful colour, and were very fine; whilst Gros Maroc were equally so. The 2nd place was taken by Charles J. Massey, Esq. (gr., Mr. Jas. Day). In this exhibit each of the varieties shown was of fine medium quality; 3rd, Mr. W. K. D'Arcy, Stanmore Hall, Middlesex (gr., Mr. W. Tidy). Muscats were the best of this exhibit, the others being Gros Maroc and West St. Peters.

Black Hamburghs could hardly be expected in good quality, and there were but two entries in this class, and they were awarded 2nd and 3rd prizes only.

In the class for Madresfield Court, the 1st position was taken by Mrs. Wingfield with good bunches, not too highly-coloured, and certainly of inferior quality to those noticed in the 1st exhibit of twelve bunches of Grapes; Earl Cowley was 2nd, and had better-coloured berries, but the bunches were smaller; and Andrew Pears, Esq., Spring Grove, Isleworth (gr., Mr. W. Farr), was 3rd, with bunches larger than either of the other two exhibits, but lacking finish greatly.

The best Gros Colmar, or Gros Maroc, came from Messrs. de Rothschild, Gunnersbury Park (gr., Mr. Reynolds), who had Gros Maroc in medium-sized bunches of very fine berries and splendid colour; Sir Joseph W. Pease was 2nd with the same variety; and C. Lee Campbell, Esq. (gr., Mr. S. S. Wright), who had fairly good Gros Colmar. There were seven exhibits in this class.

Black Alicantes were shown best by T. Astley, Esq., Coombe Bank, Kingston (gr., Mr. C. Griffin); the fruit was good in bunch and berry, and the colour excellent. J. Chaffin, Esq. (gr., Mr. Wm. Taylor) was 2nd. He had larger bunches, but the finish was not so good; Henry Tate, Esq. (gr., Mr. Wm. Howe) was 3rd.

The class for any other black variety not mentioned above, was won by J. Massey, Esq., with Gros Guillaume, in very large and good bunches. Messrs. De Rothschild were 2nd, with Alnwick Seedling; and William Saunders, Esq., Vine Cottage, Junction Road, Andover, 3rd, with the same variety. There were seven exhibits.

The next class was for Muscat of Alexandria, and W. K. D'Arcy, Esq., proved most successful with good bunches of finely finished berries. F. Bevan, Esq., Trent Park, new Barnet (gr., Mr. W. H. Lees), was 2nd; and C. Boyer, Esq. (gr., Mr. J. Bury), 3rd, with much larger bunches, but lacking finish. There were ten exhibits.

The remaining class was for any other white Grape, and the winner was L. J. Baker, Esq., Ottershaw Park, Chertsey (gr., Mr. T. Osman), who had good bunches of Dr. Hogg; Messrs. De Rothschild were 2nd, with Buckland Sweetwater; and R. Sneyd, Esq., Keele Hall, Staffs (gr., Mr. J. Wallis), 3rd, with Golden Queen.

Peaches.—Three dishes distinct, were capitally shown by Mr. J. Gore, fruit grower, Polegate, Sussex, who was 1st with dishes of Princess of Wales, Sea Eagle, and Walburton Admirable. Mr. G. Woodward, gr., Barham Court, Maidstone, was, however, a near and good 2nd, with Nectarine Peach, Princess of Wales, and Sea Eagle. Sir Joseph Pease, Bart. Hutton Hall, Guisborough, Yorks, was 3rd, his best dishes being Bellegarde and Exquisite. The best single dish was shown by Ralph Sneyd, Esq., Keele Hall, Newcastle-under-Lyme, Staffs (gr., Mr. J. Wallis), who had a splendid dish of Sea Eagle, being the best Peaches in the exhibition—they were large, and of very fine colour. 2nd, Mr. Lunt, Keir Gardens, Dunblane, N.B., who had a good dish of Walburton Admirable; and 3rd, Viscountess Falmouth, Merewoorth Castle, Maidstone (gr., Mr. H. Markham), with Princess of Wales in good form, considering they were taken from an exposed east wall.

Nectarines.—Ralph Sneyd, Esq., was 1st also for a dish of Nectarines (there was no entry in a class for three dishes), with good-sized fairly coloured Victorias; and William Pope, Esq., had higher colour but less sized fruits. 3rd, the Hon. D. P. Bouverie (gr., Mr. S. Haines).

Figs.—For a single dish, William Pope, Esq., was 1st, showing Brown Turkey; 2nd, C. W. Parker, Esq., The Priory, Witham (gr., Mr. S. Kerry); 3rd, the Hon. D. P. Bouverie. All the winners had Brown Turkey, but the quality was not remarkable.

Tomatos.—Four dishes of distinct varieties, nine fruits in each dish, were best from Mr. J. Gore, who had splendid dishes of Trophy, Challenger, Ham Green, and a good variety called Polegate; the last-named and Ham Green Favourite were the best. The next collection was one from Henry Tate, Esq. (gr., Mr. Howe), who had Hackwood Park, Sutton's Perfection, Ham Green Favourite, and a variety called Silver Invincible. Mr. E. Rider, Orpington, Kent, was 3rd. There were six other exhibitors, and the class made a fine display. The best single dish was one from Mr. S. Garraway, Bailbrook, Bath, an exquisite sample of Perfection. F. C. S. Roper, Esq. (gr., Mr. John Blake), was 2nd, with Sutton's Perfection; and Messrs. H. & E. Wells, Hounslow (gr., Mr. Geo. Thompson), was 3rd. There were six other exhibitors in this class also. The remaining class for Tomatos was one for six ripe clusters, cut from the plants, of one variety, and the most successful exhibitor was Mr. J. Gore, who showed Polegate Tomato in splendid form. Mr. John Hill, jun., The Nursery, New Malden, Surrey, was 2nd; and Andrew Pears, Esq., Spring Grove, Isleworth (gr., Mr. W. Farr), was 3rd.

Vines in Pots.—The only exhibit of three Vines bearing fruit in pots was one from Messrs. T. F. Rivers & Son, Sawbridgeworth, who had 1st prize. The varieties were Black Alicante and Gros Colmar, but the advanced season was much against such an exhibit.

Hardy Fruit Grown under Glass.—There were several exhibits of a collection of hardy fruits, grown partly or entirely under glass, to illustrate orchard-house culture (nurserymen excluded). The best of these was from Sir Mark Collett, Bart. (gr., Mr. Potter). This collection included fourteen dishes of Apples, thirteen dishes of Pears, and two dishes of Figs, the quality being very satisfactory. The best Apples were Cox's Pomona, Cox's Orange Pippin Sandringham, Emperor Alexander, Baldwin, Peasgood's Nonsuch, Washington, and King of Tomkins County. Pears noticeable were Duchesse d'Angoulême, General Todtleben, Durondeau, and Marechal de la Cour. Sir Joseph Pease was 2nd, and he had twelve dishes of Apples, six of Pears, six of Plums, one dish each of Nectarines, Peaches, and Apricots, and two of Figs. The quality of this exhibit, though good, was not equal to that from Sir Mark Collett. J. W. Melles, Esq. (gr., Mr. Nicholson), was 3rd.

Open to Nurserymen Only.

For a collection of fruit trees in pots bearing fruits.—1st, Messrs. Rivers & Sons, Sawbridgeworth, Herts, with a fine lot of upright cordons and pyramids in pots of sizes from 10 inches to 15 inches—about thirty examples. The best fruited were Pears Doyenné du Comice, Glou Morceau, General Todtleben, Marie Louise, Uvedale's St. Germains, Beurré Bachelier, and Duchess de Mouchy. Apples: Bijou, Pomona, Wagener, and Buckingham (a Silver Medal was Awarded). Messrs. G. Bunyard & Co., Maidstone, were 2nd, with two dozen trees of about 5 feet in height, consisting of Plums, Apples, Figs, and Pears. The finest Pears were Olivier de Serres, Doyenné d'Alençon, Conference, Beurré Dumont, B. Baltet, B. Fonqueray. Apples: Gascoigne, Sturmer, Wagener, Baumann's Red Winter Reinette. Plums: Coe's Golden Drop, a number of very fine fruits.

The next important class in this section was that for a collection of hardy fruits, grown partly or entirely under glass, to illustrate orchard-house culture. Here Messrs. G. Bunyard were 1st with a grand lot of fruits, of various kinds set out on a square stand or table consisting of two tiers, the upper tier containing trees in pots, Vines, &c., shown with the idea of improving the appearance as a whole. These were well fruited examples, and helped to illustrate orchard-house culture in a telling manner. The finest dishes of fruit consisted of Gascoigne's Seedling, a showy variety, free bearing when aged; Tyler's Kernel, Baumann's Russet, Stone's, Lady Henniker, Rosemary Russet, Reinette du Canada, Newton Wonder, Okeira, Washington, Emperor Alexander, Mother, Peasgood's Nonsuch, Twenty-ounce, Beauty of Kent, Gold Medal, Belle du Bois, Ribston, &c. Pears comprised Belle d'Ecully, a large fruit, green skin; General Todtleben, extra fine; Beurré Clairgeau, Mons. Benoist, Pitmaston Duchess, Idalio, a fine-looking fruit, not unlike a monstrous Hacon's Incomparable, but useless; Beurré Superfin, Louise Bonne de Jersey, Le Lectier, Catillac, &c. (Silver-gilt Medal). Messrs. Rivers & Sons were 2nd in this class, and staged also fruit-trees in pots, consisting of Pears: Duchess, Charles Ernest, Pitmaston Duchess, Conference, and Doyenné du Comice. The Apples that were shown on dishes consisted of many of our best varieties, of which we may mention some of the finest specimens, viz., Warner's King, Emperor

Fig. 54.—THE DAHLIA GRAND DUKE ALEXIS OF RUSSIA.

Alexander, Pomona, Peck's Pleasant, The Queen, Orange Pippin, Belle du Bois, Bismarck, Sandringham, Nonsuch, King of the Pippins, Lord Derby, Washington, Scarlet Gascoigne, and Melon. The finest Pears were Pitmaston Duchess, Vicar of Winkfield, the handsome Fertility, and Conference; two early varieties, good for home consumption, Emile d'Heyst, St. Lezin, Brown Beurré, Marie Benoist, Seedling No. 11, resembling Fertility; Lebrun, a very large elongated fruit, of a yellow colour; Gregoire Bourdillon, Poire de Barriot, a pale yellow Pear; Rivers' Seedling Bergamot, Magnate, very fine; Magherman, resembling the striped Bon Chrétien in shape; and Triomphe de Vienne. The varieties of fruits in this stand, all of orchard-house culture, were Peach, Lady Palmerston; Plums, Monarch, one of the latest, a fine large dark purple freestone variety, raised from Automne Compote, which was also shown; Golden Transparent Gage, a rich good Plum for the end of September; Automne de Chamel, resembling Pond's Seedling; Cherry Guigne (*Anglice*, Gean) de Winkler, a bright red juicy variety, small, and hanging very late in September. Figs were likewise shown in some variety. An excellent exhibit of its kind, showing what may be done with hardy fruits under glass.

Collections of hardy fruits, in baskets or dishes, grown in the open.—The winners in this competition were Messrs. G. Bunyard & Co., 1st, with a large showy stand or table, on which were arranged seven pyramids of mixed varieties of Apples, with baskets piled up with fruit in the intervals, the remainder of the space being occupied with plates of fruit. The Apples, as goes without saying, were just such as Kent only can produce—large, rosy or yellow, clear-skinned specimens; it is needless to specify varieties. Some Grand Duke Plums of a dark red colour, a seedling from Autumn Compote, Bryanstone Gage (well kept) were shown; and we remarked a quantity of the handsome Princess Royal and Red Filberts, Prolific Filbert, the earliest of them all; and the Atlas Cob. A Gold or Silver-gilt Medal goes with this prize. The winners of the second place in this competition were Messrs. J. Cheal & Sons, Crawley, Sussex, who put up a very extensive collection in baskets and plates, set out with Fern in pots. Extra fine were the following:—Pears: Belle de Fonqueray, Triomphe de Jodoigne, Marie Benoist, Beurré Hardy, Alexander Lucas, Doyenné Boussoch, Kieffer, Vicar of Winkfield, Grosse Calebasse, Beurré Bosc, of fine size and appearance; Mikado, a free-bearing, ornamental variety, of a rich brown, the eye-segments of which drop out when the fruit is near maturity, leaving a deep cavity; the flavour has nothing to recommend it. The best and finest Apples consisted of Duchess of Oldenburgh, a most prolific variety this year at Crawley; Rambour, Queen, Warner's King, Frogmore Prolific, New Hawthornden, and Stirling Castle. There were Dartmouth Crabs, Cobs, white-skinned Filberts, immense Dutch Medlars, and the beautiful Archduke Plum, a most prolific culinary variety.

Fruits Grown in the Open Air (Open to Gardeners and Amateurs only).

Apples.—The present has not been a favourable season for Apples, owing to the great thinning effected by the frosts; the fruits that were left have made good and large specimens, though lacking to some extent the colour obtained in a more sunny season.

In the class for eighteen distinct dishes, to include twelve cooking and six dessert varieties, Mr. Geo. Woodward won 1st place, with a splendid lot, most of them being large perfect fruits, and very fairly coloured. Most noticeable amongst these were Stone's, Emperor Alexander, Northern Dumpling (very large), Peasgood's Nonsuch, Mère de Ménage, Beauty of Bath, Golden Spire. Dessert varieties were Worcester Pearmain, Cox's Orange Pippin, Washington Wealthy, Ribston's Pippin, and Barnack Beauty, all capital.

Another good collection was one from C. Lee Campbell, Esq., Glewston Court, Ross (gr., Mr. S. T. Wright); but the 2nd prize could not be awarded, owing to a dish of Twenty-ounce being considered by the judges to be identical with Warner's King, and therefore a duplicate. To meet the case, however, an extra prize was awarded. Ecklinville Seedling, Spencer's Favourite, Warner's King, Frogmore Prolific, Golden Spire, Cox's Pomona, Devonshire Quarrenden, American Mother, Worcester Pearmain, Washington, and King of the Pippins, were especially noteworthy.

Mr. A. T. Killick, Weavering, Maidstone, was 1st in the class for twelve dishes, to include eight cooking and four dessert varieties. In this fine exhibit were Bismarck, Ecklinville Seedling, Mère de Ménage, Warner's King, Peasgood's Nonsuch, New Hawthornden, and Blenheim Orange, Worcester Pearmain (good), Ribston Pippin, Cox's Orange Pippin, and King of the Pippins. The 2nd prize was taken by Viscount Gage, Lewes, Sussex (gr., Mr. George Helman), whose best dishes were Peasgood's Nonsuch, Warner's King, Blenheim Orange, Cox's Orange Pippin, King of the Pippins, and Ribston Pippen. 3rd, The Rev. E. Bartrum, D.D., Wakes Colne Rectory, Halstead (gr., Mr. Graves), who had good but medium-sized fruits of good colour.

In the next class, which was arranged for nine dishes to include six cooking and three dessert, there was only one exhibitor, and the 1st prize was withheld, a 2nd prize being awarded to Lady Fortescue, Dropmore, Maidenhead (gr., Mr. Charles Herrin).

Mr. George Woodward showed splendidly in a class for six distinct dishes of cooking Apples, and had fine dishes of Belle du bois, Peasgood's Nonsuch (very even and good), Alexander (size and colour excellent), Warner's King, Lord Suffield, and Stone's; C. Lee Campbell, Esq., was 2nd, and had a good collection, being well ahead of Mrs. L. A. Killick, Langley, near Maidstone, who was 3rd.

For three dishes of cooking Apples, there were twelve or more entries, and a very close competition. In the end, the 1st prize was won by Mrs. Killick; she had Peasgood's Nonsuch, Ecklinville Seedling, Mère de Ménage; the fruits were shown in their true character, being splendid specimens. 2nd, J. R. Bavingham, Esq., Bridge House, Carshalton (gr., Mr. W. Jones), with Peasgood's Nonsuch, Warner's King, and Dutch Codlin; Jno. Hargreaves, Esq., Maiden Erlegh, near Reading (gr., Mr. T. Turton), was 3rd; his Lord Suffield dish was fair.

The best six dishes of dessert varieties were shown by Mr. George Woodward, who had good, even, and well-coloured fruits of Washington, Wealthy, Worcester Pearmain, Barnack Beauty, Ribston Pippin, and Cox's Orange Pippin. C. Lee Campbell, Esq., was 2nd, again with less-coloured and rather smaller fruits; King Pippin, Worcester Pearmain, and Margil were very good. 3rd, Mr. W. S. Dawson, The Links, Plumstead Common (gr., T. A. Heston).

The best three varieties were from Sir Mark Collett, Bart., St. Clere, Kemsing, consisting of King of the Pippins, Baumann's Red Reinette, and Cox's Orange, the last-named lacking in colour, though size was satisfactory; 2nd, John Hargreaves, Esq., who had very beautiful fruits of Duchess of Gloucester, also Ribston Pippin and King of Pippins; 3rd, W. Apthorpe, Esq, Cambridge, who had also a good exhibit.

Dessert Pears.

All the classes for Pears were well contested, and there was very fine quality observable in many of the exhibits not fortunate enough to obtain prizes. The 1st place for a collection of eighteen dishes, distinct, was taken by Mr. Geo. Woodward, and his best were Marguerite Marillat, a good and new variety; Pitmaston Duchess, General Todtleben, Triomphe de Vienne, another good and new Pear; Conseiller de la Cour, Doyenné Boussoch, Gansell's Bergamot, Marie Louise, Princess, and others, all of them being excellent in quality. 2nd, H. C. Moffat, Esq., in whose exhibit we noticed as specially fine, Souvenir du Congrès, Doyenné de Merode, Louise Bonne of Jersey (ripe and very good); Beurré d'Amanlis, large, and others. 3rd, A. H. Smee, Esq, The Grange, Wallington (gr., Mr. Cummins), with a nice even collection of moderately-sized fruits.

For twelve distinct dishes, H. S. Vincent Ames, Esq., Westbury-on-Trym (gr., Mr. Bannister), was 1st. His best fruits were those of Pitmaston Duchess, Doyenné Boussoch, Beurré Clairgeau, and Duchesse d'Angoulême; 2nd, A. Basile, Esq., Weybridge. Lord Suffield, Gunton Park, near Norwich (gr., Mr. Allan), was first for nine dishes, and there were nine other collections in this class. The quality was first-rate, and the varieties were General Todtleben, Marie Louise d'Uccle, Pitmaston Duchess, Doyenné Boussoch, Beurré Diel, Doyenné du Comice, Marie Louise, Glou Morceau, and Durondeau. Captain Harcourt Rose (gr., Mr. Cotterill) was a splendid 2nd, his best dishes being of Pitmaston Duchess, Beurré Superfin, Brockworth Park, and Marie Louise; J. R. Bavingham was 3rd. The best six dishes were shown by Mrs. Crawford (gr., Mr. Slogrove), among ten other competitors. She had Doyenné Boussoch, Brockworth Park, Doyenné du Comice, Beurré Superfin, Pitmaston Duchess, and Beurré d'Amanlis; 2nd, Earl Cowley (gr., Mr. Gibson); and 3rd, Mr. W. A. Cook. The Dowager Lady Freake (gr., Mr. Rickwood) beat ten other exhibitors for three distinct dishes, showing, in capital form, dishes of Pitmaston Duchess, Doyenné du Comice, and Durondeau; 2nd, Mr. Jas. Hill, who included some very fine fruits of Louise Bonne of Jersey; and some large Pitmaston Duchess were in the 3rd collection, shown by Mr. W. Apthorpe.

Pears (stewing).—Mr. George Woodward won for three dishes of stewing Pears, with Vicar of Winkfield, General Todtleben, and Catillac. Captain Harcourt Rose was 2nd; and F. C. S. Roper, Esq. (gr., Mr. Blake), 3rd. In the class for a single dish, there were twelve entries, and the competition was keen. The Countess of Camperdown (gr., Mr. Masterson) won, with moderately-good fruits of Uvedale's St. Germain; Mr. W. A. Cook was 2nd; and Mr. T. S. Girdler, Rosedale House, Lowther Hill, Forest Hill, S.E., 3rd.

Peaches, &c.

Mr. George Woodward, with capital dishes of Princess of Wales, Nectarine Peach, and another, had 1st prize, for a collection of three dishes; the Countess of Camperdown, Shipston-on-Stour (gr., Mr. Masterson), being 2nd, with Walton Admirable, Barrington, and Late Admiral; 3rd, F. A. Bevan, Esq., New Barnet (gr., Mr. W. H. Lees), who had good dishes of Exquisite and Princess of Wales. In the competition for a single dish, the 1st prize fell to Viscountess Falmouth, Mereworth, who had Princess of Wales; Mrs. Hulse (gr., Mr. Sclater) was 2nd, with Sea Eagle; and Mr. S. Fennell, Tunbridge, 3rd.

Nectarines.—There was but one entry for three dishes of Nectarines, and a prize was awarded to Mr. W. Pope, Newbury, for a collection of moderate quality. In the class for a single dish there were five competitors, and the 1st position was taken by Andrew Pears, Esq., Spring Grove, Isleworth, Surrey (gr., Mr. W. Farr), for a dish of good Albert Victor; Earl Cowley was 2nd, and T. Astley, Esq., Kingston-on-Thames (gr., Mr. Griffin), 3rd.

Plums, &c.

Dessert Varieties.—The season is late for Plums, but there were numerous entries in some of the classes. The 1st place for four dishes of dessert varieties was taken by W. H. Long, Esq., Trowbridge (gr., Mr. Strugnell), with Transparent Gage, Golden Drop, Reine Claude de Bavay, and Bryanstone Green Gage; the Countess of Camperdown was 2nd, and C. J. Massey, Esq. (gr., Mr. Day), 3rd.

J. Hargreaves, Esq., was the best among eleven other competitors for a single dish, and showed Coe's Golden Drop; Mrs. Wingfield, Ampthill (gr., Mr. Empson) was 2nd, and Mr. R. Edwards, Sevenoaks, 3rd, each showing same variety as the 1st prize winner.

Cooking Varieties.—Mr. W. Pope secured 1st place for four dishes of cooking Plums, with splendid Coe's Golden Drop, Pond's Seedling, White Magnum Bonum, and Victoria; C. J. Massey, Esq., was 2nd, having Prince Engelbert, in the place of Coe's Golden Drop; and J. Hargreaves 3rd, who included Autumn Beauty and White Perdrigon.

Eleven competitors staged one dish of one variety, and the winner was Mrs. Wingfield, with Grand Duke; the Rev. E. Bartrum was 2nd, with Pond's Seedling; and Viscountess Falmouth 3rd, with Grand Duke.

Gage Plums.—The Countess of Camperdown won for one dish of any green or golden variety of Gage Plum, staging Reine Claude de Bavay; 2nd, Lady Fortescue, with Transparent Gage; and 3rd, Sir J. W. Pease, Bart., having Bryanston's Green Gage. For one dish of any purple Gage, there was one entry only, and a 2nd prize was awarded to Mr. J. Neighbour, Epping, for Purple Gage.

Damsons and Prunes.—For three distinct dishes, Mr. Astin T. Killick was 1st with Truant and Farleigh Damsons, and another; 2nd, G. W. Dawson, Esq. (gr., Mr. Heston).

Bullaces.—For a single dish of Bullaces, Mr. G. Tebbutt, Mogden House, Isleworth, was 1st; F. G. Arbuthnot, Esq., Bexley (gr., Mr. Wells), 2nd; and W. G. Dawson, Esq., 3rd.

Morello Cherries.—A dish of fine Morello Cherries came from the Countess of Camperdown. The Dowager Lady Freake was 2nd, and Mr. R Edwards 3rd. Most of the Cherries were of poor quality only.

Nuts.—In a class for a collection of Nuts, including one dish of each variety shown, the best came from J. Hargreaves, Esq., who had dishes of large-fruited French Walnut, another and smaller early fruiting Walnut; Webb's Prize Cob, Red-skinned Filbert, Hazel, and Cosford. Mr. Goodwin, of Mereworth, was 2nd; and Colville Browne, Esq., Horticultural College, Swanley, was 3rd.

Quinces.—The remaining class in this division was for a dish of Quinces, and the 1st prize went to A. J. Howard, Esq., Isleworth (gr., Mr. Peatney); 2nd, A. J. Humphrey, Esq. (gr., Mr. Barleycorn); 3rd, Mr. Wingfield. There were four other exhibitors.

Single Dishes of Dessert and Kitchen Apples Grown in the Open Air. (Open.)

Adams' Pearmain. There were five dishes of this, the best being from Mr. Geo. Woodward, being of even size and good colour. Mr. W. Tayler was 2nd, and the English Fruit and Rose Co., Hereford, 3rd.

Braddick's Nonpareil.—The English Fruit and Rose Co. staged the best among three other exhibits, Mr. W. Tayler, who was 2nd, having large and coarser fruits.

Cox's Orange Pippin.—There were eleven exhibits of this popular Apple, and it was well shown. W. H. Long, Esq., had capital fruits; Mr. H. Berwick was 2nd, and Viscount Gage (gr., Mr. Helman), 3rd.

Golden Reinette.—There was but one exhibit, and this was awarded 1st prize. It came from Mr. H. Berwick.

King of the Pippins.—This was an extremely popular class, as many as twenty-three dishes being staged. Captain Harcourt Rose was 1st with beautiful fruits; the English Fruit and Rose Co. 2nd, and Mr. Garraway 3rd. All these exhibits were excellent.

Lady Sudeley.—There were only four competitors for this somewhat new and very pretty early Apple. Mr. R. Edwards was 1st, and Mr. H. Berwick was 2nd. The other prize was withheld.

Mannington's Pearmain.—F. S. W. Cornwallis, Esq. (gr., Mr. Mackenzie), beat six other competitors with a capital dish; 2nd, J. W. Melles, Esq.; and 3rd, Mr. George Woodward.

Margil.—This handsome variety was good and well coloured from Mr. Geo. Woodward and Mr. James Spottiswoode, who were 1st and 2nd respectively; 3rd, Viscount Gage.

Mother, American.—F. S. W. Cornwallis, Esq., staged good fruits of capital colour of this variety; and Mr. Geo. Woodward, who was 2nd, was followed by C. Lee Campbell, Esq. These were all good, and there were three other exhibitors.

Reinette du Canada.—Among four other dishes, that of Mr. George Woodward was best, the fruits being in true character, and very even; Mr. W. Tayler was 2nd, and the English Fruit and Rose Company 3rd.

Ribston Pippin.—C. Lee Campbell, Esq, was best in the class for this capital variety, and amongst twenty exhibitors. He was followed by F. S. W. Cornwallis, Esq., and J. Hargreaves, Esq.

Rosemary Russet.—J. Hargreaves, Esq., was 1st, with pretty good fruits; and was followed by P. Cavanagh, Esq., and Mr. H. Berwick.

Scarlet Nonpareil.—Only two dishes were staged, and Mr. George Woodward, who showed moderately good fruits, was followed by Mr. Garraway.

Worcester Pearmain.—This handsome variety was largely and thoroughly well shown. There were fifteen exhibitors, and the 1st prize was awarded to Mr. George Woodward, for splendid fruits, of remarkable colour; C. Lee Campbell, Esq., was 2nd; and F. S. W. Cornwallis, Esq., 3rd. The competition was unusually close in this class.

Any other Variety.—Here was a class for any variety the exhibitor might desire to stage, other than those above given. There were eighteen dishes, and the 1st prize was taken by Mr. Geo. Woodward, for splendid fruits of Washington; Mr. R. Edwards was 2nd, showing a good dish of Wealthy; and the English Fruit and Rose Company, with the same variety, was 3rd.

Cooking Apples.—Classes 70 to 104 were for single dishes of culinary Apples, and the entries were, if anything, more numerous than in the case of the dessert varieties. There were four competitors for a dish of Alfriston: Mr. G. Wythes, gr. to the Duke of Northumberland, Syon House, Brentford, was 1st, with fine examples; Mr. H. Berwick was 2nd; and Mr. P. Cavanagh, Convent Gardens, Roehampton, 3rd. The class for Beauty of Kent brought five dishes: Mr. G. Woodward was 1st with good fruit; Mr. C. Herrin, gr. to Lady Fortescue, Dropmore, Maidenhead, 2nd; and Mr. H. Berwick 3rd. There were thirteen competitors with Bismarck, fine examples being staged: Mr. J. McKenzie, gr. to F. W. S. Cornwallis, Esq., M.P., Linton Park, Staplehurst, was 1st; Mr. G. Woodward, 2nd; and the English Fruit and Rose Co. 3rd. There were seventeen dishes of Blenheim Orange, occupying portions of two tables, Mr. P. Cavanagh taking the 1st prize, with very fine fruit; Mr. Barleycorn, gr. to A. J. Humphreys, Esq., was 2nd; and Mr. M. R. Edwards 3rd. There were five dishes of Bramley's Seedling: Mr. S. T. Wright was 1st, with capital fruit; the English Fruit and Rose Co. was 2nd; and Mr. G. Garraway 3rd.

Cellini Pippin was represented by twelve dishes, and some very good examples were staged, Mr. H. Berwick taking the 1st prize; the English Fruit and Rose Co. was 2nd; and Mr. P. Cavanagh, 3rd. Out of fourteen competitors, Mr. J. McKenzie had the best dish of Cox's Pomona, very fine; Mr. G. Woodward was 2nd; and Mr. Turton, 3rd. There were only six dishes of Duchess of Oldenburg, Mr. A. T. Killick was 1st with fine Apples; 2nd, the English Fruit and Rose Co.; 3rd, Mr. W. Taylor. There were thirteen dishes of Dumelow's Seedling, Mr. T. Turton was 1st; Mr. Thomson, gr. to Messrs. W. and E. Wells, Hounslow, 2nd; and Mr. H. Berwick, 3rd. Ecklinville Seedling was represented by sixteen dishes, some of the fruit being very fine indeed; Mr. S. T. Wright came 1st; Mr. A. T. Killick was 2nd; and Mr. H. Berwick, 3rd. Emperor Alexander was presented in good form: out of ten competitors, Mr. J. McKenzie was 1st; Mr. G. Woodward, 2nd; and Messrs. Rivers & Son, 3rd. Gascoigne's Scarlet was represented by four dishes only, the 1st prize being taken by Mr. G. Woodward; Mr. A. T. Killick was 2nd; and Mr. H. Berwick, 3rd. There were nine competitors with Golden Noble, Mr. G. Woodward being again 1st; Mr. J. McKenzie 2nd, and Mr. H. Berwick 3rd. Mr. G. Woodward had the best dish of Golden Spire, very good indeed; Mr. J. McKenzie was 2nd, and Mr. G. Garraway 3rd. Grenadier was very fine; the best of five dishes came also from Mr. G. Woodward; Mr. C. Herrin was 2nd, and Mr. J. Mackenzie 3rd. New Hawthornden was represented by eleven dishes: Mr. T. Turton was 1st, Mr. G. Woodward 2nd, and Mr. Bannister, gr. to H. Vincent Ames, Esq., Westbury-on-Trym, 3rd. There were nine dishes of Lane's Prince Albert: Mr. S. T. Wright was 1st, with very fine fruit; Mr. G. Woodward was 2nd, and Messrs. Rivers & Son 3rd. Mr. G. Woodward had the best dish of Lord Derby, eight competing; Mr. J. Hudson, Gunnersbury House, was 2nd; and Mr. Taylor 3rd. Mr. McKenzie had the best dish of Lord Grosvenor; Mr. G. Woodward took the 2nd prize, and Mr. C. Herrin the 3rd. There were fourteen dishes of Lord Suffield, Mr. Killick taking the 1st prize with large but ungainly fruit; Mr. Woodward coming 2nd with what appeared a perfect dish: fruit large, handsome, and finely finished; Mr. H. Berwick was 3rd. There were nine dishes of Mère de Ménage, large, and well-coloured for the season: Mr. A. T. Killick was 1st, Mr. J. McKenzie 2nd, and Mr. G. Woodward 3rd. Northern Greening was represented by the type, and also by the new form: the latter, which is quite distinct, was represented by fine fruit, which gained for the English Fruit and Rose Company the 1st prize; Mr. Cotterell, gr. to Captain H. Rose, Tunbridge, was 2nd; and Mr. W. Taylor 3rd, both with the type. There were but two dishes of Newton Wonder, which is described as a "recent introduction of great merit, large and good:" Mr. S. T. Wright was 1st, and Mr. G. Garraway 2nd. Peasgood's Nonsuch was represented by fourteen dishes, some very fine indeed: Mr. G. Woodward came 1st, with a dish of evenly-balanced Apples; Mr. J. McKenzie was 2nd; and Mr. W. Taylor 3rd. There were seven dishes of Pott's Seedling; and here Mr. W. Taylor came 1st; the English Fruit and Rose Company 2nd; and Mr. G. Woodward 3rd. Sandringham was only sparingly represented, but the fruits very good: Mr. H. Berwick took the 1st prize; Mr. G. Wythes was 2nd; and Mr. G. Woodward was 3rd. There were four dishes only of Spencer's Favourite or Queen Caroline: Mr. G. Woodward was 1st, Mr. S. T. Wright 2nd, and Mr. Killick 3rd. Stirling Castle was represented by ten dishes; Mr. J. McKenzie was 1st, Mr. C. Ross 2nd, and Messrs. Rivers & Son 3rd. There were six dishes of Stone's or Loddington Seedling: Mr. G. Woodward was 1st, with fine fruit; Mr. J. McKenzie 2nd, and Mr. H. Berwick 3rd. The Queen was in good character, represented also by six dishes; Mr. G. Woodward again 1st, Mr. H. Berwick 2nd, and Mr. W. Taylor 3rd. Tower of Glamis was very fine, six dishes competing; Mr. J. McKenzie was 1st, Mr. G. Woodward 2nd, and Mr. S. T. Wright 3rd. There was but one dish of Tyler's Kernel, from Mr. H. Berwick, who was awarded the 1st prize. Warner's King was represented by seventeen dishes, including some very fine fruit; Mr. G. Woodward was 1st, Mr. J. McKenzie 2nd, and Mr. A. T. Killick 3rd. Waltham Abbey Seedling was very fine, Mr. G. Woodward taking the 1st prize, with a perfect dish; Mr. J. McKenzie was 2nd, and Mr. T. Turton 3rd. In the class for any other variety there were eighteen dishes, Mr. G. Woodward being 1st, with very fine Belle du Bois, which is regarded as synonymous with Gloria Mundi; The English Fruit and Rose Co. came 2nd, with Frogmore Prolific, also very fine; and Mr. G. Tebbutt, Isleworth, was 3rd, with very fine Lady Henniker. The unplaced dishes included fine fruits of Stone's, or Loddington, Gloria Mundi, Pomme Royale, Belle de Pontoise, and Yorkshire Beauty.

Single Dishes of Dessert Pears Grown in the Open Air. (Open.)

Beurré Bosc.—There were eight dishes staged, and the largest and best fruits were from Messrs. W. and E. Wells, Hounslow (gr., Mr. Thompson); and the 2nd prize dish from the Horticultural College, Swanley; Captain Harcourt Rose, was 3rd.

Beurré Diel.—Was shown by eleven competitors, and those from Mr. W. Tayler were large and very clear fruits. The Dowager Lady Freake, Twickenham, was 2nd; and the Duke of Northumberland (gr., Mr. Wythes), 3rd.

Beurré d'Amanlis.—H. C. Moffat, Esq. (gr., Mr. Spencer), had a capital dish, and beat a round dozen of competitors. He was followed by Earl Cowley, and Mr. Geo. Woodward; all of them were good.

Beurré Hardy.—Mr. Geo. Woodward's was the best of fourteen, the fruits being large and smooth, those from Mr. Jas. Spottiswoode, Brighton, had more colour; and Mr. J. Turner, Week Hall, Brighton, was 3rd.

Beurré Superfin.—This fine Pear was shown by twelve competitors, and with a very good dish, Mr. Geo. Woodward won the 1st place, followed by H. Vincent Ames, Esq., and H. C. Moffat, Esq.

William's Bon Chrétien.—Only five dishes were staged, and the quality was not remarkable, it now being rather late for this variety. C. J. Massey, Esq., Garliestown, Wigton (gr., Mr. Day), was 1st; W. G. Dawson, Esq., 2nd; and A. J. Humphrey, Esq., Walton, Leigh (gr., Mr. Barleycorn), 3rd.

Comte de Lamy.—Mr. George Woodward won in this class with fruits of moderate quality. He was followed by J. Hargreaves, Esq., and Col. Archer Houblon (gr., Mr. Ross).

Conference was shown only in three cases, Messrs. T. F. Rivers & Sons being 1st with fine fruits, followed by J. W. Melles, Esq., and Mr. Woodward.

Maréchal de la Cour.—Mr. Woodward's fruits that beat ten other exhibits were splendid; Mrs. Hulse, Carshalton, was 2nd; and Mrs. Crawford 3rd.

Doyenné du Comice.—This excellent variety was put up by sixteen competitors, and large, fine specimens from Sir Mark Collett won the 1st prize; Lord Suffield, who was 2nd, was followed by Viscount Gage, Lewes (gr., Mr. Helman).

Durondeau.—Mr. Geo. Woodward had a good exhibit, and was 1st; he was followed by Sir Mark Collett and Lord Suffield. There were nine other exhibitors.

Emile d'Heyst.—In this class also, Mr. Woodward was successful with fine fruits, the only other dishes being from Lord Suffield and Mr. Berwick.

Fondante d'Automne was shown by seven exhibitors, and G. W. Dawson, Esq., with nice even fruits was 1st; Mr. W. Tayler following, and Mr. W. Fife 3rd.

Glou Morceau.—Lord Suffield's dish was superb, and much ahead of Sir M. Collett, who was followed by Mr. Woodward.

Josephine de Malines.—Mr. G. Woodward had the best dish among eight others, and was followed by Mr. J. Hill, Cambridge, and H. C. Moffat, Esq.

Louise Bonne of Jersey.—There were twenty-one dishes staged, the quality of most of them being very fine. Messrs. T. F. Rivers & Sons, were 1st, with splendid and large fruits; and Mr. J. Hill, and H. C. Moffat, Esq. staged dishes of good quality also.

Marie Louise.—This ever-popular Pear was competed for by twenty-seven exhibitors, being the largest number any one dish of Pears attracted, except Pitmaston Duchess, which had twenty-eight. T. B. Haywood, Esq., Woodhatch, Reigate (gr., Mr. C. J. Slater), was 1st; Mr. C. Chard, Clapham Park, 2nd; and J. Hargreaves, Esq., 3rd.

Nouvelle Fulvie.—Exhibited but sparingly. H. C. Moffatt, Esq., who had very commendable fruits, was followed by Mr. G. Fennell and the Duke of Northumberland.

Pitmaston Duchess.—Of the twenty-eight dishes shown, the best was from Lord Suffield, and he was well followed by Captain Harcourt Rose and Mr. W. A. Cook. All these were good.

Souvenir du Congrès.—Fine examples of this useful variety placed Colonel Archer Houblon before eight

other exhibitors, but he was closely followed by Messrs. W. & E. Wells, and Messrs. de Rothschild.

Thompson's.—Lord Suffield won in this class, and was followed by Mr. H. Berwick and G. W. Dawson, Esq. The exhibits were good, and there were four other dishes staged.

Triomphe de Vienne.—This tolerably new and first-class handsome Pear was shown by three exhibitors only. Mr. Woodward had fine fruits, and he was followed by G. W. Dawson, Esq., and Mr. J. Foreman, Maidstone.

Winter Nelis.—Captain H. Rose had nice fruits of this good keeping Pear, and Mr. Garraway, who was 2nd, was followed by T. B. Haywood, Esq. There were ten other dishes.

Any other Variety.—A class left to the exhibitor's fancy, and always a popular one. There were twenty-nine entries, and Mrs. Halse, with fine large fruits of General Todtleben, was 1st; Mr. H. Berwick 2nd; and Mrs. Crawford, who had good specimens of Doyenné Boussoch, 3rd.

Special Prizes.

Six varieties of Hardy Fruits, grown in the open air, two gallons of each, and at least two kinds of fruits being represented. Market-growers only to compete. The winner of the 1st prize was Mr. Wyatt, Hatton, Middlesex, who had four varieties of Apples, viz., Ingestre, King of the Pippins, Worcester Pearmain, and Duchess' Favourite; and Pears, Brockworth Park, and Pitmaston Duchess, both good samples.

For the best ten bushels and ten half-bushels of one variety of Apples, particulars of trees, soil, system of culture, method of packing, and grading to be given (open to market-growers). 1st prize to Mr. Geo. Tebbutt, Mogden House, Isleworth. Fruit from old unpruned bush-trees, grade of the best acreage, 35 acres of mixed fruits, variety King of the Pippins (dessert).

Mr. Tebbut was 1st for one bushel of cooking Apples, Lady Henniker, fine large clean fruit; but it being an angular, rather uncouth-shaped fruit, it did not take the eye as, say, Golden Spire or Golden Noble. The produce was from bushes twenty years old, and management as before stated.

Fruit Packing.—For the best packed baskets of Grapes (12 lb.), received by rail: 1st, Mr. Gore, Polegate; 2nd, Mr. McIndoe, Hutton Hall Gardens, Darlington; 3rd, Mr. C. Cooper, Ascot.

The best-packed box of ripe Peaches, twenty-four in number, received by rail: 1st, Mr. G. Woodward, the packing being wood-wool, and tissue paper in which to wrap each fruit. The boxes were about 13 by 19 by 3 inches. 2nd, Ralph Sneyd, Esq. (gr., Mr. Wallis), Keele Hall, Stafford, the packing cotton wool wound round each fruit over tissue paper; these had travelled well, but the wool costs more than the wood-wool, cannot be cleaned, and soon gets unelastic. 3rd, A. J. Howard, Esq. (gr., Mr. Pentney).

Best-packed box of twenty-four ripe Pears: 1st, Mr. G. Woodward, packing same as with Peaches. Dimensions of box, 2 feet by 1½ foot by 4 inches. 2nd, Mr. Garraway; in this case the packing materials seemed too scanty, the box about the same size as the previous one. 3rd, Mr. J. Clarke, Farnham; in this case the packing was not first-class.

For Mr. G. Munro's and Webber's prize for the best packages superior to the ordinary bushel and half-bushel baskets for the carriage of Apples, the competition was very small, and the 1st prize was secured by Mr. Savage, Peckham.

A. Weir, Esq., Bendarroch, Ottery St. Mary, Devon, showed samples of packing choice Apples in boxes with wood-wool, viz., a 5 lb. box with the fruits placed in one layer; and a 21 lb. box with several layers. The cost of wood-wool was given at 6*s.* 6*d.* per cwt. (we think it is cheaper), and packthread for tying boxes together 4*s.* 6*d.* per 12 lb.

Messrs. Colby, Hinkley & Co., 10, Tudor Grove, Wells Street, Hackney, showed a new kind of wooden market basket to supersede the Willow baskets now in general use, and which are dear to buy, easily decay, bruise the fruit placed in them, and which cannot be packed as empties one inside another. The basin-shaped baskets shown have the advantage of packing one within another, thus taking up comparatively small space, of being strong, light, smooth inside and out, and are furnished with a lid formed of a wooden-hoop and strong slats, so as to admit of ample ventilation. The price is, we believe, less per dozen than that of ordinary baskets.

Messrs. C. H. Clover & Co., Ormside Street, Old Kent Road, London, S.E., showed nests of boxes, of a capacity of 1 lb. each, for the sending by rail, &c., of berries, Tomatos, and soft fruits generally; also the materials of which the boxes are made, in a handy cut-up form, for export, or sending long distances at home. It seemed a great improvement on the methods in common use.

Miscellaneous.

A large and important position among the trade exhibits of fruit was taken by that from Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, Chelsea, and displayed on two large tables, the Pears upon one of these, and the Apples on the other, there being about 150 dishes of the former, and 170 of the latter. The new Marguerite Marrillat was shown, and there were pretty dishes of Dr. Hogg, Gansell's Bergamot, Beurré Hardy, Seccle (especially good), and very many others. On this table also were a few of the later Plums. Several varieties of Damsons also, and the Wilson Junior Blackberry, and Rubus laciniatus. This last-named Blackberry is a very free cropper, and is strongly recommended; the fruits are not large, but good. The Superlative Raspberry was also shown.

Glancing at the other table, we noticed nearly all of the best varieties of Apples were represented by good and, in many cases, excellent fruits.

A considerable space of the western portion of the nave was occupied by collections of Apples and Pears, with here and there a dish or two of Plums and Medlars, exhibitors in some cases covering one and some two tables each of about 150 superficial feet. Messrs. J. Laing & Sons received a Silver-gilt Knightian Medal for a collection covering two tables, comprising about 250 dishes of Apples and Pears, with large basketfuls of leading varieties. One object of interest was two tiny trees, each in a pot, budded at the end of August, 1893, and each bearing a fruit of Bismarck. A Silver Knightian Medal was awarded to Messrs. Spooner & Sons, nurserymen, Hounslow, who set up a very fine collection, the fruit bright and clear, and well coloured. A Silver Banksian Medal was awarded to Messrs. C. Lee & Son, nurserymen, Hammersmith, who had a large table filled with best varieties of Apples, and a supplemental one with Pears. A Silver Banksian Medal was also awarded to Messrs. B. Peed & Son, Roupell Nurseries, Streatham, who also filled a large table with dishes of Apples and Pears. A Silver Banksian Medal was also awarded to Messrs Paul & Son, Old Nurseries, Cheshunt, also with a large table of Apples and Pears.

From the School of Handicraft for Poor Boys at Chertsey, Mr. A. J. Brown, Instructor in Horticulture, came forty-five dishes of Apples and Pears of a very creditable character. From the Gardens of the Royal Horticultural Society at Chiswick came eighty-four dishes of Apples.

The Conference.

(From our Special Reporters.)

Hardy Fruits for Small Gardens.

The proceedings of the Conference in the afternoon of Saturday were devoted to the reading and discussion of a paper on this subject, prepared by the Rev. W. Wilks, M.A., Vicar of Shirley, Surrey, Secretary of the Royal Horticultural Society, and Mr. George Bunyard, F.R.H.S., The Nurseries, Maidstone. In the absence, through severe illness, of the Rev. W. Wilks, the paper was read by Mr. Bunyard, who at the outset gave Mr. Wilks all the credit for the real work connected with the preparation of the paper. By "small" gardens was meant, for the present purpose, gardens in which from half an acre to an acre and a half was set apart for fruit and vegetable culture. If fruit was to be grown to any reasonable extent in a small garden at all—if, the gardener was expected to furnish the dinner-table with relatively as much of fruit as he did of vegetables, than rather more than half the space at his disposal should be devoted to it. One way in which a great economy of space could be made in small gardens, is by planting standard Apples and Plums, and early Pears and Cherries, in the pleasure garden. An Apple-tree planted in front of a couple of evergreen Oaks, and surrounded with an undergrowth of Rhododendrons or Laurustinus, &c., would make a lovely picture. Or a half-standard Apple, with the lower branches encouraged at first so as to sweep down upon the turf, was quite as pretty as nine-tenths of the lawn-trees that one saw. Yellow Ingestre made a charming lawn Apple, on account of its beautiful drooping habit. A standard Williams' Bon Chrétien on the Pear stock (if an early Pear be wanted) would make a lovely object; Beurré d'Amanlis and Jargonelle, were both of handsome foliage, and had much finer flowers than Williams' Bon Chrétien, but the flavour of Amanlis was not equal to that of Bon Chrétien, and Jargonelle so very quickly rotted. Plums and Cherries would also clothe the garden with a wealth of blossom in the spring, quite as beautiful as many of our so-called ornamental trees, besides providing a wealth of fruit in the autumn, and adding immensely to the general interest of the pleasure-garden. A Mulberry and a Medlar, if they were had at all, should certainly be on the lawn, the foliage of the Mulberry, and its peculiar growth, making it a good contrast to almost all other trees; and the massive white blossoms of the large Dutch Medlar, and the glorious tints of its foliage in autumn, marked it out as a desirable ornamental tree, without considering its fruit, whilst its drooping habit rendered it not unfitted to cover a low summer-seat. Roughly speaking, every third tree in any pleasure-garden might, without disfigurement, or lessening of the general effect, be a fruit-tree. All fruit-trees in the ornamental garden should be grown on the extension system, that was, pruned but sparingly, the leaders of all the branches being allowed almost free play, cutting back only to balance the head when young, the side-shoots being clean cut out to a couple of buds, if the inner growth appeared too dense.

Turning to the kinds of fruits to be grown, and the varieties of each to be preferred, it was impossible to lay down any hard-and-fast rule. In the same way, the proportion of the various kinds to one another would depend, to a great extent, on the preferences of each household. Setting aside individual cases, the order of relative importance, from a household point of view, would probably be nearly this, viz., 1, Cooking Apples; 2, Cooking Plums; 3, Gooseberries; 4, Strawberries; 5, Raspberries; 6, Red Currants; 7, Dessert Apples; 8, Dessert Plums; 9, Cherries; 10, Black Currants; 11, Dessert Pears; 12, Stewing Pears; 13, Medlars; 14, Quinces; 15, Mulberries. Peaches, Nectarines, and Apricots were not spoken of, as though, in a sense hardy in the South of England, they were far better grown in an orchard-house.

Apples for Cooking should be from five to eight in number. For the earliest, choose either Pott's Seedling, Ecklinville, Grenadier, or Lord Grosvenor; for second Apple, Warner's King or Stirling Castle; third, either Tower of Glamis or Blenheim Orange; fourth, Lane's Prince Albert in bush form, or Wellington, or New Northern Greening; fifth, either Bramley's Seedling, Newton Wonder, or Alfriston; sixth, Bismarck or Golden Noble; seventh, the second out of the three named for the fifth place, so as to make sure of late-keeping Apples; and if an eighth be possible, Lord Derby (in bush form); ninth (strongly advised), Annie Elizabeth, the latest Apple of all, which keeps good up till May. In this way, except for spring frosts, which no forethought could avoid, there would be a supply of Apples the whole season through. Apples required well gathering and well keeping. When they parted easily from the tree they were fit to pick.

Plums for Cooking.—Five varieties would suffice:—First, Rivers' Early Prolific; second, The Czar; third, The Sultan, or Belgian Purple; fourth, Victoria; fifth, Pond's Seedling, or Monarch. If possible, add a tree of Damson, either Farleigh or Bradley's King, and one of Shepherd's Bullace. Sharp look-out should be kept for bullfinches during blooming.

Gooseberries.—There could scarcely be too many bushes—twenty-five to forty at least. Every collection should include Whitesmith, Bobby, Crown Bob, Pitmaston Green Gage, Whinham's Industry, Keepsake, Early Sulphur, Warrington, Leader, Brown Girl, and Leveller. The bushes should be grown in a patch, for ease of netting, and very early fruit could be had by planting cordons on a south or west wall.

Strawberries.—These, like Gooseberries, must, in the country, be netted before they begin to colour, or the birds will not leave one to ripen. They should therefore be in beds, and not planted as an edging to the paths, as was so often seen. There should be at least 350 to 500 plants. For a light soil, plant Vicomtesse Héricart de Thury for next gathering, President or Sovereign third, Countess, and latest, Gunton Park or Lord Suffield. Some other varieties might be tried, viz., Noble, Latest of All, British Queen, Lucan, Georges Lesuir, and Filbert Pine.

Raspberries.—A line of from 100 to 200 yards in length would not be too much. Red Antwerp was still the best for flavour, though perhaps Superlative

was to be preferred, owing to its prolific bearing, and its flavour was not far behind. Red Antwerp and other good kinds were Carter's Prolific, and Norwich Wonder.

Red Currants.—A very few of these would suffice if plenty of the better fruits were grown. About twelve bushes would be enough, half being of Red Dutch and half of Raby Castle. To plant white Currants, as white Raspberries, was to waste good ground, but if they were required, the best were White Transparent and Versailles.

Apples for Dessert.—Five of these should be planted, and mostly in bush form. In their order of bearing they should be:—Irish Peach or Devonshire Quarrenden, Lady Sudeley, Gravenstein or Worcester Pearmain, Cox's Orange—the prince of all dessert Apples. If later varieties were wanted they would be best found amongst Sturmer Pippin, Duke of Devonshire, or Rosemary Russet.

Plums for Dessert.—All kinds of Plums should be grown, either on a wall or fence, in bush fashion. Three or four would probably be enough. Deniston's Superb would be the first, followed by Rivers' Early Transparent, and that again by Jefferson's, ending the season with Coe's Golden Drop, which should have a wall. Greengages should be avoided where bullfinches abound.

Cherries.—The finest Cherries for dessert were Early Rivers (black), and Kent Bigarreau (white); and for cooking, none could approach Kentish. A north or a north-east wall could be used for planting a Morello against.

Black Currants.—About ten or twelve bushes of these should be grown, as they make excellent jelly. The best variety was Baldwins, or if that could not be had true, Lee's Prolific.

Pears for Dessert.—Pears are of little value in an ordinary family where no great amount of company is kept, and dinner parties are not of constant occurrence. The earliest Pear advised is Williams' Bon Chrétien, either as a standard or bush tree. This may be followed by Louise Bonne, Beurré Hardy, Pitmaston Duchess, and Durondeau, all of which do well as bush trees or espaliers. Marie Louise is a somewhat over-rated Pear. The best of all Pears is Doyenné du Comice, and a Winter Nelis should be tried.

Pears for Cooking.—These should be in bush or espalier form, the fruits being so heavy. Catillac is the best for the purpose, the blossom being really most beautiful and ornamental.

Medlars.—The variety called Large Dutch forms a very pretty small lawn tree. Few people seem to know how very delicious Medlar jelly is.

Quinces.—If there be any odd damp corner, or an unoccupied spot near a pond, a Quince-tree is always useful. The Pear-shaped variety should be preferred.

The paper also gave suggestions for planting and pruning. The best time for planting all fruits is late October and throughout November. Strawberries should be planted in August or early September. Just digging a hole, cramming the roots in, shovelling the soil over, stamping it down and leaving it, is the wrong way to plant any trees, and can only result in failure. The right way is, break up all the earth to a depth of 18 inches, either in a square or circle of at least 3 feet across, but without bringing the bottom spit to the top. If the roots are in any way jagged or torn, cut the points cleanly off with a sharp knife, and at the same time shorten back all the straight-downward roots, unless they will easily bend outward to right and left; place the tree in the hole at such a depth that when the planting is finished it will be at the same depth as it was in the nursery, which will be easily seen by the soil-mark on the stem. The depth should be such that the uppermost roots will be about 3 or 4 inches below the surface when the planting is finished. Spread out the lowest roots carefully on the soil in the hole, and scatter a little fine earth over them; then spread out the roots next above these, adding more soil, then those above them, and so on, giving a little shake now and then to let the soil run in between the fine roots. When all the roots are spread out and covered, give the trees a good vigorous shake, add a little more soil, and then tread it in firmly, and fill up the hole slightly above the surrounding soil, as it will sink 1 or 2 inches; put a strong stake to the tree, and be sure that the way the two are fastened together is such as to make it impossible for the stem of the tree to chafe itself against the stake when the winds blow; protect the trees from rabbits, cattle, and sheep. No dung whatever should be used under the ground. It is important not to plant too deeply, especially in wet or heavy lands. It is important to spread out all the roots down to the smallest fibres.'

Many other details, all of which are important to ensure complete success, are given in the paper, and some hints are furnished on worn-out and dilapidated gardens. "Most old gardens are benefited more by the addition of fresh turfy loam than by strong nitrogenous manure, as in time all the holding qualities of the soil in town gardens seems to vanish, and it assumes such a loose nature that the roots of fruit trees cannot duly perform their functions in it."

The Chairman, in inviting discussion, said they often learnt more from their failures than from their successes. He then told the meeting of a gentleman who was taught by bitter experience, because contrary to instructions, his trees were planted too deep; and because a dead dog, a dead cat, and butchers' offal, were placed at the roots of some Pear and Apple trees. Trees could not live on such food, said the Chairman, who added, that as they would not go to a cheap grocer for their tea, so they should go to none but the best sources for their fruit trees.

Mr. John Wright paid a high tribute to the Rev. Mr. Wilks' paper. No mention had, however, been made of the grand old favourite among Strawberries, Sir Joseph Paxton.

Mr. Bunyard said the flavour was not good enough.

Another gentleman in the hall suggested that it was "worn out."

Mr. Wright vigorously defended Sir Joseph Paxton from these onslaughts. He was glad to see the importance attached by Mr. Wilks to the Gooseberry and the Raspberry. These were the fruits for the amateur, as they gave an ample return for a space allotted to them. He mentioned a man who divided his allotment from his neighbour's by a hedge of Raspberries. The hedge was 75 yards long only, but after consuming all he needed, the grower sold between £3 and £4 worth each year. That was an example of how to utilise ground which might have been planted with a useless bush. In fruit culture, knowledge, judgment, and ordinary business commercial care were needed. Being a Liveryman of the City of London, he would like to tell them a secret, and make a suggestion. The Master of the Fruiterers' Company would in all probability be Lord Mayor next year. The suggestion was, that the Royal Horticultural Society should hold another show next year, which should be opened by the Lord Mayor in state, who would bring all London with him.

Mr. H. R. Williams, who has been twice Master of the Fruiterers' Company, and whose prize of 25 gs. and Gold Medal for an essay on the subject of the day were won by the last speaker (Mr. Wright), next spoke. He said he was sure Sir Joseph Renals, if Lord Mayor, would gladly open the next year's show. The speaker went on to allude to the long discussion which has been going on in the *Times* on the subject of fruit growing.

Mr. Rivers also alluded to the *Times* correspondence. He said that if an orchard gave three years' profit out of five they ought to be satisfied. The remainder of the rent would be paid by the bush-fruits. He would like to give to the meeting a recipe for canker, which had been made by Mr. Tonks of Birmingham. It had proved most successful, and was as follows:—

	lb.
Superphosphate of lime	35
Nitrate of potash	21
Nitrate of soda	28
Sulphate of lime	28

A quarter of a pound to the square yard, should be applied in the autumn and spring.

Mr. Bunyard said that Mr. Blackmore was a distinguished novelist, a most estimable gentleman, and a very clever fruit grower; but he lacked the commercial tact to put what he had grown to the proper market and in the proper way. Those were things which every man must learn who wished to succeed in fruit culture.

Second Day's Conference.

Fruit Growing on a Large Scale.

The second day's conference, held on Monday, October 1, was devoted to thereading and discussion of a paper on this subject, prepared by Mr. Charles Wise, agent for the Toddington Estate, and manager of the fruit farms established by the Right Hon. Lord Sudeley. Mr. Bunyard presided, and there was a crowded meeting.

Mr. Wise began by saying, that owing to the great increase in the fruit-growing industry a good deal had been written during the past few years on fruit farming and the enormous profits to be made. The bulk of these reports were greatly exaggerated, although under certain conditions fruit growing yielded a fair return on capital expended. Many people thought that fruit trees had merely to be planted and profitable returns in due course were assured, but it was only by experience, and in many cases by loss of capital, that they found that fruit-growing was a business and a science. The question asked again and again was—Why do not farmers go in for fruit-growing? The simple answer was, that not only did they not know how to set about it, but they had not the necessary capital. And even should that be forthcoming, it was not on every farm that land adapted for fruit-culture was to be found. There were also these important considerations:—(1) There are only selected areas where you can hope to succeed, so far as soil, shelter, and situation, are concerned; (2) Fruit-growing, especially on a large scale, should be within reasonable distance of a great market or railway station; (3) The tenant must be prepared to stand out of his capital for certainly four years, or perhaps longer, before a fair return is obtained; and no tenant should plant on a large scale, except under a lease of at least twenty-one years, and with compensation for improvements, fully assured at the end of his tenancy (a sentiment loudly applauded by the meeting). Given suitable soil and situation, with railway accommodation at hand, and security of tenure, he was of opinion that hundreds of acres of land might be planted with fruit, to the advantage of both landlord and tenant. We heard a great deal of what the Royal Commission was going to do for the tenant-farmer, but he feared that unless the tenant-farmers looked after themselves, they would obtain very little help from that quarter.

Soil.—Mr. Wise divided his paper into headings, the first being soil. Most soils would, he said, grow fruit, a good strong, deep loam being preferable. Shallow soil, on gravel or on chalk, was the least suitable, especially for standard fruit trees, though Strawberries might do well in certain seasons, and the same remark applied to sandy land. Land should be thoroughly drained before planting commenced, though not over-drained, as the trees as they grow older would take up a great quantity of moisture. Great advantage would accrue from having an analysis made of the soil.

Situation.—This point was, he thought, the most important of all, and was frequently overlooked. Many acres of fruit trees were planted in unfavourable situations, which year after year yielded no return whatever. Low-lying situations should be avoided, because in them the frost took most effect. He found that plantations that were not lower than 250 feet above sea-level, as a rule escaped frost, although the higher they were the better. He would urge all not to plant in the valley.

Sorts.—In making a selection, it was best to observe what varieties did best in the district. If uncertain as to what would do best, the beginner should try to commence with two or three kinds of bush fruit, and say four or five varieties each of Plums, Apples, and other tree fruit. They would soon answer the question.

Strawberries.—In his district, the most suitable for market were Vicomtesse Héricart, Sir Joseph Paxton, President, and Stirling Castle Pine for main crop. The usual method was to plant with a dibble, but he was convinced that if more time were taken in planting, and a small three-tine handfork used, the plants would make a far better start, and the extra labour would be more than repaid. Runners should be taken from one to two-year-old plants, and if the weather was suitable and ground ready, they should be planted as soon as they were well rooted. Plants cost from 10*s.* to 15*s.* per 1000, and if half an acre was planted, and the runners were all left the following summer, there would be a large stock of plants available. The cost of planting would be about £8 to £10 per acre, exclusive of manure, if the land was clear and in a good state of cultivation. The average annual returns might be taken at 2 tons per acre at £20 per ton net. The beds lasted five to six years, after which the plants began to fail, and should be grubbed up. He had heard this season of 170 tons of Strawberries being bought in one district alone by a large jam maker, which showed the very large demand there was for this fruit. The foreigner had not yet been able to place fresh Strawberries on our breakfast-table,

Raspberries.—These were fond of a good friable loam. They would not thrive on a thin soil, nor would they do well on stiff clay land. Carter's Prolific, Semper Fidelis, and Superlative, were all good sorts for market. The canes cost about 20*s.* per 1000, and planting would amount to about £14 per acre exclusive of manure. Cultivation and manure cost about £8 per acre exclusive of picking. On suitable soil Raspberries would stand ten to fourteen years, and in many cases still longer. The average crop was 2 tons per acre, and an average price £25 per ton net.

Black Currants.—These liked a good strong soil. Baldwin's Black, Black Naples, Lee's Prolific, and Carter's Champion were all excellent varieties. They might be planted 5 feet apart, which took 1750 per acre, and the bushes should be cut down to within 6 inches of the ground after planting. Planting would cost about £12 per acre, including the purchase of the young bushes at £4 per 1000. Exclusive of picking, the cultivation, including manure, cost about £8 per acre, and an average crop might be taken at about 2 tons per acre. The price, which varied, was this season down to £14 per ton, owing to the heavy crops. The average price might be taken at about £25 per ton net.

Red Currants.—Scotch Red was a very good early variety, with Raby Castle and Dutch Red for main crop. Young bushes might be bought at £3 per 1000, and the cost of planting should not exceed £10 per acre. Red Currants were more regular croppers than black; but the average crop could not be taken at more than 2 tons per acre, although he had known 5 tons per acre grown two or three years in succession. The average price for the past few years could not be taken at more than £14 per ton net.

Gooseberries.—Of the many different sorts recommended, Whinham's Industry and Berry's Early were good early varieties, with Crown Bob, Lancashire Lad, Warrington, Keepsake, and Whitesmith to follow. He knew of one plantation this season on which 5 tons of Lancashire Lad were grown to the acre, the price realised being £12 per ton; cost of planting, £13 per acre. Pruning full-grown bushes cost from 2*s.* 6*d.* to 3*s.* 6*d.* per 100. Picking costs from 1*s.* 6*d.* to 1*s.* 9*d.* per cwt., and cultivation about £10 per acre, including manure. On suitable land the yield should average at least 3 tons per acre, if not 4 tons. On no account should Gooseberries be planted on wet land; they would bear heavy dressings of manure. Green Gooseberries averaged about £14 per ton, and ripe about £9 per ton.

Nuts.—The Kentish Cob Nut was the best, if not the only Nut, to grow. They would do well on stony ground. Nuts would pay well for good treatment. A return worth speaking of should not be looked for for at least six years from the time of planting. Young bushes cost about 30*s.* per 100, and the cost of planting Nuts only would be about £5 per acre. The average crop might be taken at 10 cwt. per acre; price, 6*d.* per pound. The cost of cultivation with standard trees, Apples or Plums, 36 feet apart, together with bush fruit planted among the nut trees would be about £15 per acre, including manure.

Plums.—Coming to the planting of standard fruit trees and mixed plantations, Plums were first dealt with. Mr. Wise said out of the forty varieties of Plums he would select as the most profitable to plant River's Early Prolific, Czar, Violet, Pershore, Egg Plum, Victoria, Black Diamond, Burns, Orleans, Belgian Purple, Prince Engelbert, Cox's Emperor, Pond's Seedling, White Magnum, and Grand Duke. Picking was done by the cwt.—about 8*d.* per cwt. was given for a fair crop. He had known a plantation of Black Diamonds, twelve years old trees—in a good year yield 10 tons per acre. Two to three tons of Plums per acre might be taken as an average crop at £10 to £12 per ton.

Gages should only be planted in a nice warm sheltered situation. The Old Green Gage, Oullin's Gage, Bryanstone, Denniston's, and Purple Gage, were all good sorts, though preference should be given to the Old Green Gage and Oullin's Gage.

Damsons.—The Damascene was largely grown in the Evesham district. It was a free cropper, and could generally be relied upon for a crop. The Blue Prolific was a good early variety; Shropshire, or Prime Damson was one of the best, and the Farleigh or Crittenden was a great cropper. Crop 2 tons per acre.

Apples and Pears.—Apples and Pears might be grown either as dwarfs or standards. At five years a dwarf Apple on the Paradise stock yielded a good return, while it was ten or twelve years before a standard Apple was in profitable bearing. Foreign supplies had enormously increased, and we recommend planting good early varieties of cooking Apples, which would come in about August—a time when the foreign supply was at its lowest. In 1882 Apples imported amounted to 2,386,805 bushels, valued at £783,903 or 6*s.* per bushel; and in 1892 4,514,700 bushels, valued at £1,353,812 or 6*s.* per bushel. It was worthy of note that although the foreign supply had nearly doubled in the past ten years, the price remained the same, showing the increased demand. Mr. Bunyard in his work, *Fruit Farming for Profit*, gave the average crop of Apples at 130 bushels per acre at 2*s.* 2½*d.* per bushel nett, and Pears at rather more.

Cherries.—These are usually grown as standards, though certain varieties did well on the Mahaleb stock as pyramids. Standards are about twelve years before they come into profitable bearing, and when they reach that age, they are extremely prolific. Very large returns are still obtainable from some of the old Cherry gardens. For the best varieties he referred them to *Hints on Vegetable and Fruit Farming*, by Mr. Charles Whitehead.

General Remarks.

Mr. Wise recommended the buyer to go to a first-class nurseryman, as he could then rely on the trees being true to name, and worked on suitable stocks. Cheap trees might be picked up at sales, but they did not pay in the long run. As soon as the trees arrive from the nurseryman, they should be carefully heeled-in for fear of the frost. On no account should a lot of manure be put into the holes with the trees; this only encouraged rank growth. If half-standards were planted, no stakes would be necessary, which saved a heavy item of expense. Nice young stocks should be chosen; they would get established, and go on much more quickly than older ones. Standard and half-standard trees might be bought at from £5 to £6 per 100.

Manuring.—Of all manures good farmyard manure was the best; but as this was not always obtainable, artificial manure had to be used. Stable manure should be put on once in three years, and about £5 worth of artificial per acre should be used on plantations in full bearing the other years. It was here that an analysis of soil was so useful. It was better, if possible, to purchase all artificial with a guarantee, and to have a sample analysed. In young plantations, it was a mistake to manure heavily, as it only caused the young trees to run to wood. Shoddy, fish guano, leather dust, damaged decorticated cotton-cake, dissolved bones, mixed with superphosphate, dried blood, horn and hoof, soot and Peruvian guano, were all excellent manures for fruit.

Returns.—Assuming a mixed plantation is planted this winter, the next summer the returns will be nil, the summer following (1896), if Strawberries only have been planted with the tree fruit, they should pay expenses; other fruits which do not come so quickly into bearing will not pay expenses until 1897, when bush fruit of all kinds should give a good profit. From a field planted with half-standard or standard trees, black Currants and Strawberries, the net return should be £20 per acre, and the average annual return for mixed plantations might be taken at that amount, though in some seasons it would be far more.

Railway Rates.—The present preferential rates were a question of vital importance, and growers should unite and do all in their power to induce the railway companies to meet them, and to re-adjust the rates.

Conclusion.—Looking at the enormous increase in the consumption of fresh fruit and jam, and the increase in the population, it hardly seemed possible that, for many years to come, fruit-growing could be overdone. The writer strongly urged growers to make all the surplus fruit into jam and "bottled fruits," and to pulp down some of the fruit in seasons of glut. Lastly, he said: Foreign competition (with the exception of Apples) ought not to materially affect our fruit trade. Soft fruit from abroad cannot be put on the market in as good condition as the home-grown, and as the public taste becomes more educated, the more demand will there be for fresh fruit and for pure jam. Jams made from imported fruit or pulp cannot compare with the jam made from fresh-gathered fruit.

Discussion.

Mr. Smith, of Loddington, near Maidstone, opened the discussion. He said that of course great allowance had to be made for different districts; as, for instance, in his district they had no market for yellow Plums. He strongly agreed with the writer of the paper, that only the best trees should be planted. Cheap trees were the most unprofitable things that anyone could buy.

Mr. Hammond, of Pilgrim's Hatch, Brentwood, said he believed that at one time their Kentish friends imagined they had got all the good soil available, and that the rest of the country had the leavings. Whether that were so or not, he and his family had for the last fifty years held their own at Spitalfields and elsewhere. Fifteen years ago he had a dispute with his landlord. He had planted a large area with fruit, and when the lease ran out, the landlord refused to renew it. After another similar experience, he decided that farming under that gentleman would not pay, so he took another farm, which he had since purchased. No one should plant under a twenty-one years' lease. Farming could then be carried on with greater confidence, and more interest. With regard to yellow Plums, the secret was to grow only when there was a market. He had every reason to be satisfied, and he was not going to throw up the sponge despite foreign competition or preferential rates. It was a downright shame that they should have to fight the question, but if they produced fruit as good as they possibly could, and sent it to market in the best possible condition, and only used common sense in growing, they could hold their own.

Mr. Basham of Basselly, Newport, Mon., said that he had learnt a great deal from the paper. He had taken an interest in fruit-growing for some years past. So far, he had been successful, although he was living somewhere near the mountains of Wales. Although in many parts of the country the past season had been a failure, yet he had taken sufficient Apples from trees which he planted last winter to pay for the cost of the trees, and when he saw the exhibits that day, he felt sorry that he had not competed. He could not see that it was fair that the English farmer should have to compete so unfairly with the foreigner, but still he saw no hope in having protection granted, and he had come to the conclusion that if they were to beat the foreigner at all it would be by producing a far better class of fruit than the foreigner was able to place upon the market. Last year at the Drill Hall he saw an exhibit from Nova Scotia. What he then saw was worthless compared with his own produce. Mr. Wise considered that five tons per acre of Gooseberries made a pretty good return for Gooseberries, but during the past season he (the speaker) had over eight tons per acre of splendid fruit. Pears had done remarkably well, and those referred to by writers to the newspapers, must have been grown on trees that had not been properly pruned and manured. From what he had seen that day, he was determined to persevere.

Mr. Cheal, of Lowfield Nurseries, Crawley, Sussex, alluding to the *Times* correspondence already referred to, said they heard a very different tale from men of practical experience. It was only the disappointed and sour men who could find time to write to the papers [!]. He warned novices against rushing into farming without looking to the end, because if they did not know what they were aiming for, they would not know where to begin. Markets had to be considered, soil had to be taken into consideration, and if this were done, they would hear far less about failures and unprofitable plantations, and the doleful stories related in the Press. He considered that in the preserving of fruit we had one of the most important operations for the future, because up to the present in a season of glut fruit was either wasted or sold at an unremunerative price. He always endeavoured to have some bottled fruit on his shelf. If the fruit were properly bottled, it could not be distinguished from fresh fruit.

Madame Sales, of Upper Norwood, asked whether the Society could not do something to get Parliament to move in the matter of either prohibiting preferential rates to the foreign or placing the English producer on the same footing?

The Chairman (Mr. Bunyard) said the question could not be kept clear from [party] politics, as of course it involved the subject of protection, and that the Royal Horticultural Society did not mean to enter upon. The Society will, however, do all it can to assist traders, and the council would favourably receive any representations made to them.

Mr. D. T. Fish, of Bury St. Edmunds, wished Mr. Blackmore could have been present. The tap-roots were the very centre and key-note of modern fruit-culture. The tap-roots had been the ruin of fruit-culture in thousands of gardens and orchards; indeed, he was not quite sure whether it was not owing to the tap-roots that the *Times* had been making

such a fool of itself. If these tap-roots were allowed to make tracks for Australia, there was no wonder that Pears were but a little better than hard sticks. Every tree was worth a stake, or it was not worth planting. He was quite in sympathy with the meeting on the question of railway rates, and he did not consider it a question of [party] politics. The preserving of fruit was a question of immense importance. Prices varied because fruit was so perishable.

Mr. Wise, in responding to the Vote of Thanks, would not be drawn into the subject of tap-roots. He, however, said that he "believed that tap-roots should be stopped, and that if Mr. Fish thought he used tap-roots instead of stakes for the trees at Toddington he was greatly mistaken!

Madame Sales asked whether the tap-roots should be cut before or after the planting.

Mr. Fish replied that it should be done before. The tap-root was antagonistic to the production of fruit, and only went to the making of timber.

A vote of thanks to the Chairman closed the Conference.

Third Day's Conference.

The third day was devoted to a paper on "Packing, Grading, and Marketing Fruit," by Mr. George Monro, F.R.H.S. Mr. Philip Crowley, F.L.S., presided. Owing to the overcrowding of the two previous days, Mr. Weathers, the Assistant-Secretary of the R.H.S., obtained a much larger hall, which was again filled by the audience.

Mr. Monro, in the course of his paper, said: I propose to note how we pack now compared with, say, twenty years ago; to compare our methods with foreign methods; to see if we cannot improve our methods; and to deal with the great importance of keeping pace with the times in competition with the foreigner. Taking the hot-house produce twenty years ago, Grapes used to be brought to market by growers near London in punnets holding 2 lb. to 4 lb., and by rail in all sorts and sizes of boxes; but as the trade grew it was found impossible to sell the quantity in this way, and at the present time the handle-basket, holding on an average 12 lb., is found most suitable for rail, and the shallow for those sent by vans. As quantities increase the grading is improved, some senders making three or four different samples of Grapes out of the same house, which is of great help to us in obtaining the best possible price, and in giving every customer the quality he requires.

Peaches used to come in punnets from local growers, and all sorts and sizes of boxes. Now we have a uniform box containing from eighteen to thirty-six, according to size, and customers know to order the size they want of different growers, and will often take them without seeing them. Growers should bear in mind that we want colour as well as size in Peaches.

Strawberries, forced, still come in the flat punnets of ½ lb. or 1 lb.; but with increasing quantities growers find it pays best to sort into two or three sizes, and by having uniform boxes containing so many punnets, it simplifies the sale very much. And when it is considered that we have to handle from ½ ton to 1 ton of morning-gathered forced fruit between 8 and 11 in the morning, it will be seen that every facility for quick sale is necessary.

Cucumbers now come in hampers, containing two to three dozen each; and sometimes upwards of 2,000 hampers are received in our market daily from March to July. We are creating quite a trade in Cucumbers with Hamburg and other foreign places, and successfully competing with the foreigner on his own ground.

Tomatos were scarcely known on the market twenty years ago, but the supply now is enormous. Best growers grade these into four sizes. The stalks are cut close to the fruit to prevent them piercing each other.

We will now turn to strictly outdoor fruits, and take them as they ripen. I don't think we can improve on the Kent method of upright punnets in a box containing sixty each; and the pecks are suitable, as the softness of the fruit requires plenty of ventilation, and in this fruit we need not fear foreign competition.

Cherries, Currants and Gooseberries come next, and the peck and ½ bushel are the most suitable, as they, too, need ventilation. The French are far ahead of us in the tasty way in which they put theirs up, the finest cherries being in small square baskets containing 4 to 6 lb. The basket is given with the fruit.

Plums are also packed in pecks or ½ bushels, but as a rule with much less care than those coming from the Continent.

Apples and Pears are sent in bushels and ½ bushels. I cannot say packed, as the bulk are simply thrown in without grading, and there is nothing to prevent the fruit being bruised by the basket. These are certainly packed worse now than they were twenty years ago; and as the competition from abroad is keener every year, it is very important that we should stop to consider whether we are working on the proper lines or not.

The hot-house fruits are not yet much affected by competition, as our market gardeners have up to the present led the world. There are, of course, many growers who pack fairly, especially in Middlesex and Kent; but none of them take sufficient care, neither can the best of them compare with the foreigner. The Frenchman, even when Oranges or Lemons are not worth more than 2*s.* per bushel, wraps them separately in papers, so that not only is the fruit protected, but if one goes rotten it is not so likely to affect the others. Our methods did fairly well when fruit was all consumed in London; but growers do not take into consideration that as quantity increases a greater proportion must go on rail, and must be packed accordingly; and they also ignore the fact that ours being a damp climate, fruit wants more care than if grown in a dry climate, where there is often no rain while the fruit is ripening.

I think a great deal of the bad packing is owing to the fact that fruit growers are not practical gardeners, but have other business to attend to. Some farmers think they have done everything when they have planted the trees, and do not imagine that there is any art in either fruit-growing or packing. At present the bulk of growers wait until the crop is ready, and expect their salesmen to be prepared with an unlimited number of baskets at a day's notice. This system is becoming impossible. Every year as orchards increase, growers must be prepared with suitable packages to market the fruit, and then we shall not hear of so much being wasted whenever there is any quantity. In the case of Plums, I think a system of drying and bottling should be adopted in full seasons to prevent the whole crop being put on the market in a few weeks. It is unreasonable to imagine that it can all command a good price when forced on the market in so short a time. All fruit-growing countries but ours are prepared with a system to save part of the crop, and we must study the same question.

I will now endeavour to show the advantages of growers finding their own unchargeable boxes. (1.) They would always be able to get sufficient at a few days' notice for any crop they might have. A skilled basket-maker can only make on the average eight bushels a day, while boxes can be put together by the hundred by any unskilled labourer from wood cut into sizes by steam mills, and wood is cheaper every year while Willows get dearer. (2.) Each box could be branded with the grower's name and mark, the name of the fruit, and the variety and size; and so give customers an opportunity of seeing whose goods they are buying. This always affects the sale favourably. (3.) A cheaper rate of transit and commission would result. (4.) To cash buyers cases are a great inducement, as they can lay out all their money in fruit and not have, as at present, to leave from 25 to 30 per cent. on the baskets with the trouble of returning them. If you consider that we have, say 1,000 cash buyers with an average of £10 each to spend; at present they can only buy £6,000 to £7,000 worth of fruit, the remainder being left in the basket, and we lose the sale of from £3,000 to £4,000 worth of fruit; besides crippling an industrial class by compelling them to work part of their capital at a loss. Without this tax, trade would develop more among grocers, who won't take up English fruit because of the bother of returning and being responsible for chargeable packages. (6.) Growers would be independent of any market or any salesman, or they could send their fruit wherever they thought they could do best, which they cannot do now owing to the difficulty of obtaining baskets. (7.) Apples and Pears would travel much better closely packed in cases, and would open out clearer and of a better colour.

The last suggestion Mr. Monro made was as to the freer use of paper. It is heart-breaking to see the immense quantity of good Pears and Apples spoiled for lack of sufficient paper. With a more liberal use of this and less of the damp packing so generally used, which causes the fruit to rot more quickly, better prices would be made, especially with soft fruit such as Cherries and Currants. If these suggestions are followed the fruit-grower would reap a benefit, and the salesman would have a business in which he can take an interest and pleasure instead of as at present, dreading the time the season commences. And last but not least, we should keep many thousands of pounds in this country which now go to the foreigner.

Discussion.

Mr. Cheal, who opened the discussion, said the subject was of the utmost importance to fruit growers. Mr. Monro had not laid too much stress upon it, and if growers would only follow his advice the result would be most satisfactory. We could learn a good deal from the French in these matters. The great thing to be aimed at is to place the fruit before the consumers in the same condition as when it left the grower. They had all seen the mauling and mangling of fruit, and many growers could scarcely recognise their own produce a few hours after it left their establishments. Some time ago he had the pleasure of listening to Mr. Monro when this question was discussed in another place, and he was very much struck by a remark made by Mr. Monro to the effect that foreign fruit, although it came into the market before the English fruit was ripe, it did not act against our own growers. It only opened the way for the consumption of the English product when it was ripe. Foreign fruit competition was not therefore an unmixed evil. With regard to the preservation of fruit, a lamentable waste of soft fruit occurred, and he thought we were only just beginning to wake up to the idea, that it was possible to preserve fruit so that it might be useful throughout the year; not only as jam, but for other domestic purposes, to which bottled, dried, and candied fruits could be put. He knew, for a fact, that their Chairman (Mr. Crowley) had been most successful in drying Plums in the kitchen oven.

Mr. Archibald Weir (Ottery St. Mary, Devon), said he was perhaps one of the first small growers in England to use boxes, and in a letter to *The Field* last December he explained how he came to use them. Wool and paper should be used for the purpose, and the boxes should be made of non-resinous wood, or the fruit would be spoilt. If Apples were placed in boxes they would remain for weeks without damage, and by dealing with the consumer direct, as could in many cases be done when boxes were employed, the middleman could be dispensed with. He had compared a Kentish grower's transaction with his own: 8½ sieves of Cox's Orange Pippins were sent up from Kent at 3*s.* 9*d.* each, and 6½ sieves at 3*s.* 6*d.*, making a gross return of £2 2*s.* The expenses were commission and carriage 7*s.*, packing and carting 2*s.* The cost of the baskets was not given, therefore the net return for 280 lb. of the very best Cox's Orange Pippins was £2 2*s.* The expenses being about 17 per cent. of the gross returns. He himself, happened a little time after that to send up to London 50 boxes, which held 250 lb. of Cox's Orange Pippins. The 50 boxes with wool and paper, carriage and commission cost 3½*d.* each, the ½*d.* representing the railway freight—total 14*s.*7*d.*; the labour of grading, packing, and marking was only 4*s.*, carriage to the station 1*s.*, railway freight to a shop in town 5*s.* 5*d.* For the 250 lb. of Cox's Orange Pippins he got £3 15*s.* nett. The working expenses were certainly 25 per cent. of the gross returns, against the 17 per cent. of the Kentish grower, who did not trouble to pack and grade, but then the returns were so much larger, being 6*s.* for 20 lb. of fruit. All the boxes should have wire hinges, as screws and nails were a great drawback to the salesman.

Mr. McIndoe, gardener to Sir J. W. Pease, Bart., confirmed all that Mr. Monro had said as to the way in which fruit was damaged. They should remember that the carriage was the same for well-packed as for badly-packed fruit, and as so much more could be got for the former, the sooner everyone adopted the better.

Mr. S. T. Wright, of Glewston Court, Ross, Herefordshire, said that during the International course laid down by the writer of the paper, the Fruit Show at Edinburgh, he endeavoured to do a little business with some shopkeepers there, but they would have nothing to do with the English fruit owing to the way in which it was packed, preferring to get their supplies from America. He had been making £1 1*s.* per cwt. for Ecklington Seedlings, and 15*s.* for Worcester Pearmain; but when the foreigner could get men to work for 8*s.* per week, and had preferential railway rates, the matter became very serious.

Mr. W. Roupell said a friend of his once met a lad driving a cart laden with Apples close to the Crystal Palace. On being interrogated, the lad said no one

at Covent Garden would take the Apples, and a bargain was struck that the lad should, on his own suggestion, sell the lot at 3*s.* 6*d.* "a whole bushel." The Apples were graded and packed by his friend, who made 100 per cent. on the transaction. The principle adopted by the lad's father seemed to be to go round the country, and buy up what fruit he could on the trees. He would then gather all he could; would shake down some more, and those he could not shake down he would knock down. With regard to the preserving of fruit, it was a mistake to suppose that cyder could only be made from cyder apples. Any hard, heavy apples would do. Excellent perry, preferable to a great deal of the wines we get in this country, could be made from Pears.

Mr. Assbee spoke of the importance of grading, and said best strawberries would fetch, say 1*s.* 6*d.* a lb., whereas if they were lumped together with all the inferior ones, the whole lot might be sold for only 4½ a lb. A better return could be got for the better fruits alone, than for the whole crop together. They could therefore save time, labour and expenses, and give the worst fruit to the pigs.

Mr. Monro said he was afraid that the ordinary grower would not like to give 3½*d.* for each box.

Mr. Colvile Brown, manager of the Horticultural College, Swanley, asked whether Mr. Monro could suggest any means, whereby small quantities sent from small growers might be placed on the market with better advantage?

Mr. Monro observed that small quantities had not the same opportunity as large ones on the market. Customers were always in a hurry; they had so many things to select, that they had to do it in a wholesale way.

Mr. Roupell in proposing a vote of thanks to Mr. Monro, suggested that something more should be done to bring comparatively unknown varieties before the London public.

The Chairman, replying to a vote of thanks, explained how he dried Plums. He placed them in the kitchen oven. The oven door was left open, and the Plums were placed on a galvanised wire of ½ inch mesh, which took the place of the ordinary oven shelf. They were kept in for about two nights and one day, and were then put into bottles and corked. They kept exceedingly well, and made an excellent fruit.

The proceedings then closed.

AN ONION SHOW AT BANBURY.

September 27.—The exhibition of pedigree Onions, instituted by the late Mr. Henry Deverill, seedsman, Banbury, was held at the Seed Stores, in the Market Place, on the above date, a large number of very fine bulbs being staged, much more fully ripened, brighter, and handsomer than could have been expected, regard being had to the dull and wet character of the summer. The six largest and handsomest specimens of any one of Deverill's Onions were those of Ailsa Craig, from Mr. H. Kneller, The Gardens, Malshanger Park, Basingstoke, weighing 12¾ lb., and finely finished in every way. These were selected out of twelve exhibits.

The best twelve of the globe-shaped Onions, viz., Ailsa Craig, Advancer, Cocoa-nut, and The Original Excelsior, were staged by Mr. T. Wilkins, gr. to Lady Theodora Guest, Inwood House, Blandford, the variety Ailsa Craig weighing 23½ lb. Mr. Kneller was 2nd, with the same variety; and two other prizes were awarded: one to Ailsa Craig, which appears to be the largest grower of the pedigree stocks; and to The Cocoanut, a very distinct shaped variety. Of the flat-shaped Onions, Rousham Park Hero, Anglo-Spanish, The Lord Keeper or Royal Jubilee. The best twelve were the first-named, from Mr. Wilkins, weighing 16¾ lb. very finely finished; Mr. Haines, Coleshill Gardens, Faringdon, came 2nd, with Anglo-Spanish, very handsome, and well ripened; this variety took the 3rd prize; and Lord Keeper the 4th.

The best twenty Onions shown by cottagers and allotment-holders were Ailsa Craig, and they were grown in the neighbourhood of Basingstoke.

TUBEROUS BEGONIAS.

The beauty of these plants has eclipsed this year that of Pelargoniums, as bedding plants; and their season of bloom extended up to the present time, and barring frost of 4° or 5° degrees of intensity, the plants will continue to afford a quantity of flowers. The long duration of these flowers is well exemplified at the nurseries of Messrs. J. Laing & Sons, Forest Hill, S.E., where a large fieldful was recently to be seen in fine flower, which, for the time of year may be said to be quite dazzling. The plants are arranged in their colours, white, yellow, rose, carmine, scarlet, crimson, and intermediate shades, affording the visitor an excellent idea of the appearance made by the plants in masses. Improvement always going on has been made in the poise of the flower, and the sturdiness of the foot-stalks, which results in the flowers being carried almost erect, thus showing the glowing interior instead of the dull exterior, at was once universally the case with this section of tuberous-rooted Begonias. The female flowers in some strains have become almost eliminated, an advantage from some points of view, as the plants last longer in flower, and no hand-picking of seed-pods is required. Scent has also come to this hitherto odourless species, and Messrs. Laing have a variety with blossoms of the exact tint and fragrance of the Maréchal Niel Rose.

A hint to planters. If the flowers of, say, a bed of Begonias, should show the face of every flower in any given direction, do not plant till the leaves are advanced in growth, and then plant with the leaf points directed towards the desired side.

NEW INVENTION

LABEL-HOLDER.

Mr. E. H. Harry, 3, Woodview Terrace, Archway Road, Highgate, N., sends us samples of a label-holder, which seems to us likely to be very useful. The stalk of the label is made of zinc, sufficiently stout to resist the attacks of hoes and rakes, and to defy the jobbing gardener to uproot. At the top are four clips, which serve to keep the label in place. The label can easily be inserted, and as readily removed. How far the brass-clips will resist the electrical action resulting from contact with the zinc stem, remains to be seen. Here is what the inventor himself claims for his label:—"Interchangeability and simplicity, combined with durability; as zinc, or any other metal, wood, &c., labels or tablets, may be placed into the clips or springs. The shank or stem can be always in use, thus saving storage and expense; this is an inconvenience connected with the present system of imperishable labels. Both sides of the tablet can be used for different names, thus ensuring a great saving in labels. On the score of economy, this label will be found particularly suitable to nurserymen and large establishments, where a succession of variety in planting is continually taking place. This fact will strongly recommend the use of this label for herbaceous and alpine planting. These labels can be placed on the market at prices which will compare most favourably with those at present selling."

The Preparation of Cocoa in Caracas.—Caracas Cocoa (Theobroma Cacao) is such a well-known and highly-valued variety, that it may be interesting to know, from the pen of the British Consul, how it is actually prepared for the European markets. The pods or fruits of the Cocoa after gathering are taken to outhouses and spread in the shade, where they are left for eight days, in order that they may become mellow. They are then opened with a knife, the beans taken out and placed upon tables exposed to the sun until they become red. To ferment or sweat the beans they should be placed in a cellar or in boxes and barrels, in a cool place, for four or five days, covering them with Banana leaves, with weights above, but must be stirred and aired every morning and evening, after which they are spread out in the sun and dried, until they sound hollow on being stirred, when they are ready to be put into sacks for the market. These beans roasted or boiled for some time will make an inferior kind of chocolate, destitute of any fatty principle, but very agreeable to the taste. This process is resorted to amongst the poorer classes. The ordinary class of Cocoa comes from Rio Chico and Higuerote, and the better class from Caracas. Prices range from £3 to £3 5*s.*, and from £5 to £6 per 100 pounds.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature. Accumulated. Above (+) or below (—) the Mean for the week ending September 29.	Above 42°, for the Week.	Below 42°, for the Week.	Above 42°, difference from Mean since January 1, 1894.	Below 42°, difference from Mean since January 1, 1894.	Rainfall. More (+) or less (—) than Mean for the Week.	No. of Rainy Days since Jan. 1, 1894.	Total Fall since Jan. 1, 1894.	Bright Sun. Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 1, 1894.

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending September 29, is furnished from the Meteorological Office:—

"The *weather* was rather unsettled during the earlier days of the period, with rain in many places. Over the southern parts of the Kingdom the rain was very general, and unusually heavy locally. During the latter part of the week the conditions were generally fair and dry, but slight showers were experienced along our eastern and south-eastern coasts.

"The *temperature* continued a little above the mean in the 'Channel Islands,' and just equalled it in 'England, S.W.,' but in all other districts it was rather below the normal. The height of the maxima which were recorded either on the 23rd or 24th, ranged from 68° in 'England, S.,' to 60° in 'Scotland, N.' The lowest of the minima were registered during the latter part of the period, and ranged from 26° in 'Ireland, N.,' 29° in 'Scotland, W.,' and 30° in the 'Midland Counties and England, N.W.,' to 37° in 'England, N.E.,' and to 47° in the 'Channel Islands.'

"The *rainfall* exceeded the mean in the 'Midland Counties and England, E,' but was less in all other districts, the deficit in most places being considerable. The rain experienced during the first day or two over our southern counties was very irregularly distributed. The newspapers report that at High Wycombe on the 23rd, 2·75 inches fell in an hour and a half.

"The *bright sunshine* was in excess of the mean in most of the western and northern, but was rather deficient in the eastern and southern districts. The percentage of the possible duration ranged from 51 in 'Ireland, S.,' and from 44 in 'Ireland, N.,' to 29 in 'Scotland, E.,' and 28 in the 'Midland Counties and England, S.W.'"

MARKETS.

COVENT GARDEN, *October* 4.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

POTATOS.

Trade slow, except for best samples. Prices:—Snowdrops and Main Crops, 80*s.* to 90*s.*; Hebrons, 70*s.*; Giants, 50*s.* to 60*s.*; Blacklands, 45*s.* to 50*s.* per ton.

SEEDS.

LONDON: *October* 3.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that there is now a good demand for new English Winter Vetches, handsome samples of which can be bought on very tempting terms. Seed Rye keeps steady at the recent advance of 1*s.* per qr. Scarcely any attention is yet devoted to Clover seeds. As regards Canary seed, although the demand for same off the stands is in small compass, values continue wonderfully firm. There is no change in Hemp seed. Linseed is quiet. New Mustard and Rape seed offer at moderate rates. The new Haricot Beans just landed meet a ready sale. Peas unchanged.

POTATOS.

BOROUGH AND SPITALFIELDS: *October* 2.—Quotations ranged from 45*s.* to 85*s.* per ton.

FARRINGDON: *October* 4.—Quotations:—Snowdrops, 80*s.* to 95*s.*; Magnums, 50*s.* to 60*s.*; Hebrons, 65*s.* to 75*s.*; Regents, 65*s.* to 75*s.*; Early Rose, 50*s.* to 55*s.*; Blacklands, 45*s.* to 55*s.*; Kidneys, 60*s.* to 70*s.*; Rounds, 45*s.* per ton.

STRATFORD: *October* 3.—Quotations:—Magnums, Dark-land, 45*s.* to 50*s.*; do., Light-land, 50*s.* to 65*s.*; Sutton's Abundance, 60*s.* to 70*s.* per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 75*s.* to 135*s.*; do., inferior, 45*s.* to 120*s.*; hay, best, 65*s.* to 130*s.*; do., specially picked, 135*s.*; do, inferior, 30*s.* to 60*s.*; Mixture, 90*s.* to 120*s.*; and Straw, 25*s.* to 40*s.* per load.

NOTICES TO CORRESPONDENTS.

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** PLANTS, FRUITS, ETC., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

BLUE BEANS: *Silly Season.* There is nothing unusual in this. The variety is well known as the "purple podded Bean." The flowers are also of a lilac colour. It is a very productive variety. Some specimens were shown at the Crystal Palace on Saturday last.

BOOKS: *Anxious to Learn. Choice Stove and Greenhouse Plants*, and the *Orchid Manual*, both edited and published by Mr. Williams, Victoria and Paradise Nurseries, Holloway; *Trees and Shrubs for English Plantations*, by Augustus Mongredien, published by John Murray, Albemarle Street, London, W.

EUCHARIS: *W. M.* Yes; certainly there are a few Eucharis-mites, but as they have not penetrated far, you may save your bulbs. Wash them, dust them thoroughly with Pyrethrum powder (flea-powder), and then grow them on vigorously. Keep them in a house away from other bulbous plants.

FRUIT: *Bon Chrétien.* The imperial bushel contains about 42 lb. of Apples. Pears may be slightly heavier. The Covent Garden sieve contains 28 quarts, and is therefore 4 quarts less than an imperial bushel. The price for good Williams' Bon Chrétien may be about 2*s.* 6*d.* per half-sieve. Why not inquire of the salesman? Thank you for the donation of 2*s.* 6*d.* for the Gardeners' Orphan Fund.

GARDENERS' ORPHAN FUND: Received with thanks, W. T. H. Clenwick, 4*s*; Bon Chretien, 2*s.* 6*d.* Sent to Secretary.

INSECTS ON LAWN: *J. W. T.* The larvæ arrived dry and shrivelled. It is apparently that of the Fern Chafer (Rhizotrogus solstitialis). By all means encourage the birds; the grass will soon recover from their operations in search of the grubs. *R. McL.*

INSECTS: *A Subscriber, Worksop.* The grubs are those of a common weevil (Otiorhynchus). They feed on a variety of different plants, and it is thus impossible to say how they were introduced. You might try gas-water or some other insecticide; it is always difficult to deal with these underground larvæ. Search for the perfect beetles at night with a light in the spring, by shaking the plants over sheets of paper. *R. McL. F. Martin.* It would have been more satisfactory to have had specimens of the perfect beetles, but there can be little doubt the grubs are those of the Fern Chafer (Rhizotrogus solstitialis). Use gas-water copiously, or petroleum emulsion. The birds, if not molested, will probably do more good than any insecticide, and the grass will speedily recover from any damage caused by them when in search of the grubs. *R. McL.* The formula for the above emulsion is as follows:—Dissolve ½ lb. hard soap in 2 quarts of boiling water, and mix thoroughly till it forms a creamy liquid; dilute with water to 2 gallons before using it. This is too strong for some kinds of plants, and experiments should be made at various strengths, so as to kill the insects and not injure the vegetation.

LARVÆ ON APPLE TREES: *Cherry Ripe.* The larvæ in the bark of the Apple are those of some small beetle, impossible to identify without seeing the perfect insect. The other creatures are a young wood-louse, and a "red spider." *R. McL.*

NAMES OF FRUITS: *J. A.* Grape, Gros Maroc.—*J. R. Smith.* Pear Brown Beurré.—*W. H.* Apple Small's Admirable.—*A. E. C.* 1, Easter Beurré; 2, White Doyenné; 3, Beurré Diel; 4, Beurré d'Amanlis; 5, Beurré Superfin.—*R. C. H.* 1, Hessle; 2, Beurré d'Amanlis; 4, Colmar d'Été; 5, Doyenné Gris.—*J. R. H.* 1, Beurré d'Amanlis; 2, Bergamotte d'Esperen; 3, Bonne d'Ézée; 4, Marie Louise; 5, Verulam; 6, Maréchal de la Cour.—*A. E. F.* 1, Beurré Diel; 2, Aston Town; 3, Beurré d'Amanlis; 4, 5, Williams' Bon Chrétien; 6, not recognised.—*H. W. H.* Pear Beurré Bosc.—*George Davison.* 1, Beurré d'Amanlis; 2, Bergamotte Espèren; 3, Hacon's Incomparable; 4 and 6, Duchesse d'Angoulême; 5, not recognised.—*D. McD.* 1, Winter Redstreak; 2, Tom Putt; 3, Autumn Pearmain; 4, King of the Pippins.—*Nomenclature.* Long, Beurré Bachelier; round, Doyenné Boussoch.—*W. B. V.* 1, Doyenné Gris; 2, Duchesse d'Angoulême; 3, Brown Beurré; 4, Duchesse d'Angoulême; 5, Vicar of Winkfield; 6, Uvedale's St. Germain.—*No name.* (Great Western consignment note at bottom of box, fruit packed in hay). 1, Beurré Diel; 3, Maréchal de la Cour; 4, Van Mons Leon le Clerck; 6, Marie Louise d'Uccle; Easter Beurré and Gansell's Bergamot numbers.—*J. Sheppard.* Apple, Dumelow's Seedling; Pear, Swan's Egg; Damson, probably Farleigh.

NAMES OF PLANTS: *C. W.* Saponaria officinalis, double fl. var.—*W. A. S.* Saponaria officinalis, double fl. var.—*J. S. S.* The Composite is Chrysanthemum coronarium. The blue flower is Nicandra physaloides, a Solanaceous plant, which often comes up in such situations, being probably introduced in soil from the greenhouse.—*W. T., Bath.* Yours is Dendrobium moschatum, which is not a variety of D. fimbriatum. It is not unusual for it to flower twice from the same growth, but your plant with nineteen spikes must be a very fine one.—*J. L. & S.* Grammatophyllum Fenzlianum. *Wm. W.* Orchids, next week; 2, Aster, Robert Parker, or an allied form; 3, Centaurea atropurpurea; 4, Chelone barbata.—*A. W.* Leucophytum Brownii.—*A. D. L.* 1, Rudbeckia californica; 2, Rudbeckia laciniata; 3, Melilotus cœrulea; Melilotus officinalis.—*C. K. Brighton.* Staphylea pinnata, the Bladder-nut, native of Southern Europe. —*C. G.* 1, Portugal Laurel in fruit, Cerasus lusitanica; 2, Bidens cernua, a waterside weed, allied to the Sunflower.

NOMENCLATURE QUESTIONS: *Nomenclature.* Retinospora, as a genus, has no separate existence. It is represented by certain stages of growth of various species of Cupressus and Thuya. (1) It is a matter of opinion. Bentham and Hooker placed them in Thuya, and the *Kew Index* follows suit. For botanical reasons, which we need not give here, we think they are more appropriately placed in the genus Cupressus, section Chamæcyparis, or some prefer to consider the latter section as a distinct genus. (2) The rule is to take the oldest *available* name in the genus to which the plant belongs; but there is rising a new school which enjoins us to take the oldest specific name, whatever it may be. The succeeding volume of the *Kew Index* will probably settle the points you raise. We cannot devote the necessary time and research to the matter, but we should think Prunus Armeniaca (Linn.), and P. Persica, for the Apricot and the Peach respectively, would be very appropriate, not forgetting to spell the specific name with an initial capital, to indicate that the name was once of generic value. (3) Azalea pontica and Rhododendron ponticum. The same rule applies as in case No. 2. We must wait and see what *Kew Index* will do. Our opinion is, that we shall do well in gardens to follow the *Kew Index* as closely as possible; *Nicholson's Dictionary*, though antecedent, is based on the same principles. We also think changes in nomenclature should only be accepted at the hands of competent monographers, who have, or have had, all the possible materials before them. For instance, we do not think it would be wise for anyone to alter names, merely because a change may seem to him (and perhaps is really) desirable. The change should be effected, if at all, by some responsible botanist after, and as the result of actual comparative examination of the genus, and the literature relating to it. Again, there are certain cases where garden exigencies may necessitate, or at least render desirable, a departure from strict botanical usage. In such a case, we must consider what is the object in view. Is it strictly scientific? Then stick to scientific usage, as that which tends most directly to the establishment of the truth, so far as we can grasp it. Is the object merely a matter of convenience, to enable us to know what our friends are talking or writing about, and with no desire to study the plant botanically? Then we

need follow no other rules than those of priority and good taste. It is a great mistake to apply Latin names to garden varieties under such conditions, and gives rise to great confusion between forms as they exist under natural conditions, and forms which owe their existence to the art of the gardener.

Potato Onion: *F. H.* It usually forms under ground a cluster of bulbs of irregular shape, and not a single bulb, as yours has done. Usually a weak bulb or clove will grow into a single bulb only.

Rose: *G. M.* Send your Rose to some grower.

Runner Beans: *A Weekly Reader.* It is no uncommon thing for cross-breds and selections to run back in form, colour, and other points to some more or less remote progenitor. Constant weeding out of stocks by the seed-growers does much in keeping strains true, but some plants, perhaps 2 or 3 per cent., revert.

Sunken Vine Border: *J. B.* The present is the best time in which to replant the Vines, or at least lift the roots to a higher level in the sunken part. If the border is old, get some new materials, and make a new border outside, just 1 foot or so wider than the root extend. See our Calendar this week for full directions.

Vegetable Teratology: *Aster.* Was published by the Ray Society several years ago, and is now rarely to be met with. A German revised edition has been published within the last few years.

Vinery, Cold Frames, Plum Trees, Bulbs: *X.* First of all buy a manual on *Vine Culture*, say Barron's, Thomson's, Molyneux's, or some other modern treatise. The information afforded by a perusal of a manual will prevent any great departure from proper practice. The cold frames can in winter be used for the cultivation of Violets, Freesias, Calceolarias of the herbaceous section, Brompton and Intermediate Stocks, Mignonette. Auriculas and Strawberries in pots can be protected in them. Of course, with plenty of air admitted when there is no frost. Salading, such as Lettuce, may be planted in them. With a mild bottom-heat early Lettuce, Carrots, Radishes, &c., may be raised, also Potatos, Turnips, but none of these vegetables should be sown till after the New Year. Whether used for forcing or cool culture, the side should be banked round with turves or litter or hot manure as the case may be. The Plum tree, if not very aged, may be transplanted forthwith, and for directions see this week's Hardy Fruit Calendar. If an old tree be treated, lift one half of the roots this year, the other half being lifted next autumn. Bulbs out-of-doors may consist of Daffodils in variety, especially the trumpet, Incomparabilis and Poeticus sections; Tulips, single, double, Parrot, Florentine and late Florists' varieties. Hyacinths, giving preference to single-flowered varieties; Lilies of all species; Frittilaria (Crown imperialis), F. uniflora, Gladiolus in the summer, great variety. If you have a warm border facing south with buildings on the north side, plant Montbretias, Sparaxis, Ixias, Tritonias, Crocosmas, &c.

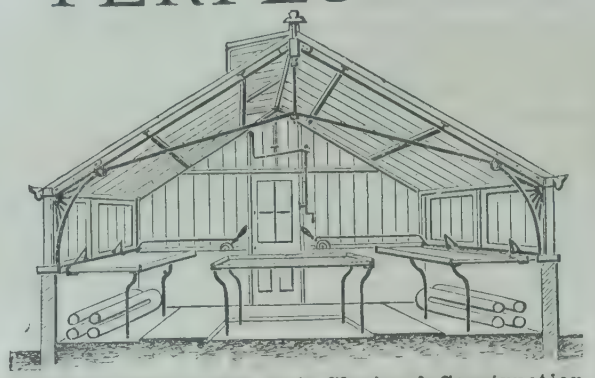
DIED.—At 25, Daneville Road, Denmark Hill, September 30, 1894, Walter Charles Tedder, aged 42 years, the youngest and dearly-loved son of James and Emma Deffner Tedder, of 149, Kingsland Road, who return their sincere thanks to his many sympathising friends for their kind inquiries during his protracted illness.



CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

Important to Advertisers.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

Increased to the extent of 80 per cent., and that it is increasing weekly.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS *at home, that it has a specially large* FOREIGN AND COLONIAL CIRCULATION, *and that it is preserved for reference in all the principal Libraries.*

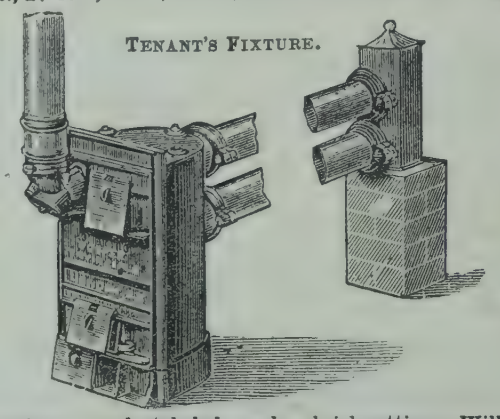
AMATEUR FORCING HOUSE.



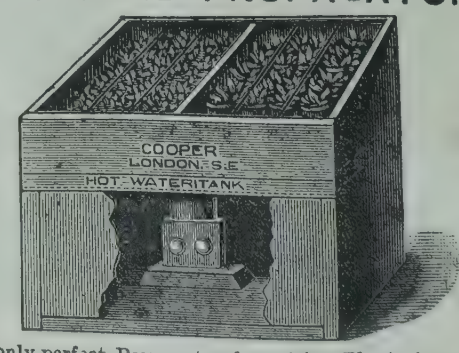
The utility of this house for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance, it being a structure constantly in request, but almost hitherto unknown. See LIST, p. 22. Send for LIST, post-free.

"INVINCIBLE" HOT-WATER APPARATUS.

Most Efficient and Cheapest in Existence.

Made in six sizes: No. 1, to drive 75 ft., £1 15*s.*; No. 2, 100 ft., £3; No. 3, 200 ft., £4 10*s.*; No. 4, 275 ft., £7; No. 5, 375 ft., £7 15*s*; No. 6, 500 ft., £9; of 4-in. pipes.

Requires no sunk stokehole, and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.



Cost of complete apparatus for Greenhouse with 4-in. pipes, flow and return along one side, cut and fitted; so that if the internal measurement of the Greenhouse is given, the apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all. Securely and carefully packed on rail at the following respective prices:—7 ft. by 5 ft., £2 15*s.*; 9 ft. by 6 ft., £3; 10 ft. by 7 ft., £3; 12 ft. by 8 ft., £3 5*s.*; 15 ft. by 10 ft., £4 5*s.*; 20 ft. by 10 ft., £5 5*s.*; 25 ft. by 10 ft., £6 5*s.* See page 186 in List.

COOPER'S HYGIENIC HEATER.

Burning Parafine or Gas without smoke or smell. These Heaters are constructed as a means of heating by Hot Air without the use of hot water or fires. Its peculiar construction economises the heat generated, so that there is no waste of heat or fuel. There being perfect combustion in this stove, and nothing whatever injurious to plants, but actually everything conducive to their health, it should be observed that plants may be had in full bloom throughout the severest winter. This cannot be obtained in stoves of other systems. The temperature can be regulated to a nicety to suit all requirements, being raised 15 degs. to 45 degs. above that of the outside. From 16*s.* complete. For full particulars, and prices of other sized Heaters, see ILLUSTRATED LIST, post-free on application.

THE RAPID PROPAGATOR.

The only perfect Propagator for raising Plants from seeds, slips, or cuttings:—

1 ft. 8 in. by 1 ft. 6 in.	£1 0 0
2 ft. 6 in. by 1 ft. 10 in.	1 4 0

"I have tried this fertiliser on various garden crops, and I am able to say that it is an excellent Manure for Vegetables, Flowers, Vines, and Fruit Trees.
"A. B. GRIFFITHS, Ph.D., F.R.S.E., F.C.S."

ARMITAGE'S INVINCIBLE MANURE.

STIMULATING! ECONOMICAL! LASTING!
The Best Fertilising Compound.

Report of Analysis made by Alfred Sibson, F.C.S., the Analytical Laboratory, 23, St. Mary Axe, London, E.C.:—
"This is a HIGH-CLASS CHEMICAL MANURE, especially suited for Garden use. It contains about 6½ per cent. of Ammonia derived from Organic matter, Ammonia Compounds, &c., and with a good proportion of Phosphates (both soluble and insoluble), Potash, &c. As its physical properties or 'condition' is also well attended to, it will, in my opinion, be found a VALUABLE MANURE for GENERAL HORTICULTURAL PURPOSES. (Signed) ALFRED SIBSON, F.C.S."

PRICES.—In Tins: 3d., 6d., and 1s. each; or Free by Post for 6d., 10½d., and 1s. 6d. In Bags: 7 lb., 1s. 6d.; 14 lb., 2s. 6d.; 28 lb., 4s.; 56 lb., 7s. 6d.; 112 lb., 14s. 6d.

NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

Vegetables.

H. CANNELL AND SONS' COLLECTION of VEGETABLES, shown at the Royal Horticultural Society and at the Royal Aquarium last week, weighing above 2 tons, not only gained the highest award for quality and purity of strain, but was pronounced by the greatest authorities to be the best collection ever exhibited in England. Onions alone consisted of 34 distinct kinds, many weighing nearly 2 lb. each; and their size, ripe high colouring, and perfect finish—open field culture—contrasted clearly with others, proving absolutely that Kent produces the most perfect and certainly the best seeds. *Standard* says: — "Finest collections of vegetables ever seen."
SWANLEY, KENT.

The Best Present for a Gardener.

VINES AND VINE CULTURE.
The most complete and exhaustive Treatise on Grapes and their Culture ever published.

HIGHLY IMPORTANT SALE

Of the Remaining Portion of the Famous

PICKERING LODGE COLLECTION

OF

ESTABLISHED ORCHIDS,

Together with the

GARDEN TOOLS, GREENHOUSE PLANTS, CARRIAGES, and a portion of the

WELL-KNOWN CELLAR of CHOICE WINES

formed by the late George Hardy, Esq. The Orchids are reputed to be the Grandest Lot of Plants in the North of England, having won the Highest Honours at Manchester and other leading Shows.

By Order of the Executors, without the slightest Reserve.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to SELL by AUCTION on the Premises, Pickering Lodge, Timperley, near Manchester, on TUESDAY NEXT, October 16 and TWO FOLLOWING DAYS, at half-past 12 o'Clock precisely each day, the Remaining Portion of this far-famed

COLLECTION of ORCHIDS.

The whole of the plants are in the best possible health, and are remarkable alike for their size and the grandeur of the varieties. For upwards of twenty years the late Mr. Hardy was an enthusiastic buyer and a keen judge, and made a practice of discarding from his collection all varieties that did not reach the highest standard of excellence. In order that intending buyers may judge for themselves of the beauty of the varieties, an effort will be made as far as practicable to offer everything in flower.

Amongst the numerous items to be offered will be found the following:

- Cypripedum œnanthum superbum
- ,, Statterianum
- ,, Swinburnii
- ,, Leeanum gigantum
- ,, Lathomianum giganteum
- ,, Io Grande
- ,, Arthurianum

ARMITAGE'S INVINCIBLE MANURE.
STIMULATING! ECONOMICAL! LASTING!
The Best Fertilising Compound.
Report of Analysis made by Alfred Sibson, F.C.S., the Analytical Laboratory, 23, St. Mary Axe, London, E.C.:—
"This is a HIGH-CLASS CHEMICAL MANURE, especially suited for Garden use. It contains about 6½ per cent. of Ammonia derived from Organic matter, Ammonia Compounds, &c., and with a good proportion of Phosphates (both soluble and insoluble), Potash, &c. As its physical properties or 'condition' is also well attended to, it will, in my opinion, be found a VALUABLE MANURE for GENERAL HORTICULTURAL PURPOSES. (Signed) ALFRED SIBSON, F.C.S."

HARDY BRUIN & CO., Graham Street, LEICESTER

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus, Will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kinds of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price, 2*s.* post-free.**
A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

W. COOPER, Ltd., HORTICULTURAL PROVIDERS,

Head Office—755, OLD KENT ROAD, LONDON, S.E.

Nurseries—The Largest and Most Complete in the Kingdom, FELTHAM and HANWORTH.

FRUIT TREES! FRUIT TREES!! FRUIT TREES!!!

This is one of our GREATEST SPECIALTIES, the soil and situation of our Nurseries being particularly adapted for Fruit Growing, and we Cultivate IMMENSE QUANTITIES of all the BEST and CHOICEST kinds in each class, including the LATEST NOVELTIES, worthless and inferior sorts being carefully weeded out. The trees are in the finest possible condition, thoroughly clean and free from blight, of robust constitution, and furnished with an abundance of fibrous roots—an important point which purchasers of Fruit Trees should not overlook, as well-rooted trees will give greater satisfaction than trees twice the size, but with stunted roots. Each kind is worked on the stock on which it flourishes best, and great care is taken to have all true to name.

APPLES, PEARS, PLUMS, CHERRIES—Standards and Pyramids, well developed trees, 18*s*., 24*s*., 30*s*., 36*s*. and 42*s*. per dozen. Two-year old Feathered trees of Apples and Pears, splendid quality, 15*s*. per dozen. Dwarf and Horizontal-trained trees, for walls, espaliers, &c., 2*s*. 6*d*. to 5*s*. each. Orchard House Trees, Pyramids, in pots, 3*s*. 6*d*. and 5*s*. each.

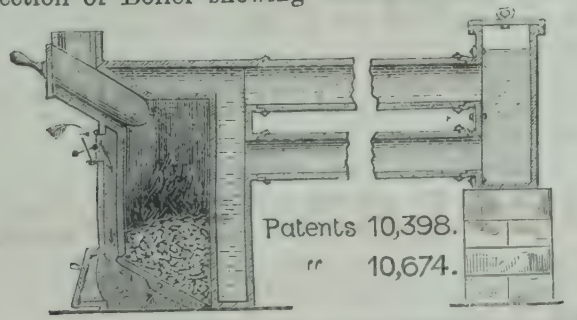
We can also supply a splendid lot of Pyramid Apples, trees that have borne fruit two and three years, of the following well-known kinds:—Astrachan Red, Annie Elizabeth, Betty Geeson, Blenheim Orange, Cox's Pomona, Cellini, Duchess of Oldenburg, Domino, Devonshire Quarrenden, Ecklinville Seedling, Grenadier, Keswick Codlin, Lord Derby, Lord Grosvenor, Lady Elizabeth de Tabley, Loddington's Seedling or Stone's Apple, Maltster, Northern Spy, New Northern Greening, Pott's Seedling, Plumbley Lass, Queen Caroline, Rose of Sharon, Ringer, Small's Admirable, and Old Hawthornden, all at 5*s*. each. Also a few extra-sized Pears at same price.

APRICOTS, PEACHES, NECTARINES—THE BEST VARIETIES. Dwarf-trained trees, 5*s*. and 7*s*. 6*d*. each. Half-Standard and Standard-trained trees, 7*s*. 6*d*. and 10*s*. 6*d*. each.

FIGS—A choice selection, fine bushes in pots, 2*s*. 6*d*., 3*s*. 6*d*., 5*s*., 7*s*. 6*d*. and 10*s*. 6*d*. each.

GRAPE VINES—All the leading varieties, strong, short-jointed, and well-ripened. Planting Canes, 3*s*. 6*d*. and 5*s*.; Fruiting, 7*s*. 6*d*., 10*s*. 6*d*. and 12*s*. 6*d*. each.

All the undernoted are for best quality, our selection only. Purchasers' selection as per Catalogue.



BLACKBERRIES, of sorts, plants in pots, 9*d*. each, 8*s*. per dozen. Ground plants, 6*d*. each, 4*s*. 6*d*. per dozen.
CURRANTS and **GOOSEBERRIES**, the leading kinds in the various colours, 3*s*. 6*d*. and 4*s*. 6*d*. per dozen; 25*s*. and 30*s*. per 100.
RASPBERRIES, finest sorts, 1*s*. 6*d*. and 2*s*. per dozen; 10*s*. and 12*s*. per 100.
STRAWBERRIES, complete collection of the newest and best varieties. Grand plants. Specially-prepared runners from ground, 3*s*. per 100. In small pots, 13*s*. 6*d*. per 100. In 5-inch pots, 4*s*. and 6*s*. per dozen.
ASPARAGUS, extra strong, for forcing, 12*s*. 6*d*. and 15*s*. per 100.
SEAKALE, extra strong forcing crowns, 16*s*. per 100.
RHUBARB, the most esteemed kinds, 6*s*., 9*s*., 12*s*., and 18*s*. per dozen.

Have at present at their Clapton Nursery two houses full of unflowered Plants, in sheath, of this useful Winter-flowering Cattleya, of which they respectfully invite inspection.

CLAPTON NURSERY, LONDON, N.E.

NEW AND BEAUTIFUL HARDY SPIRÆA.

SPIRÆA ANTHONY WATERER.

This is a sport from the well-known Spiræa bumalda, from which it differs only in colour, the flowers being a rich crimson, borne in large corrmbs thickly on the plant.

It is a continuous bloomer, and is without doubt the most important addition to hardy flowering plants of many years.

FIRST-CLASS CERTIFICATE,
Royal Horticultural Society of London.

Nice plants, 7*s.* 6*d.* each, will be distributed in November next.

THE

Gardeners' Chronicle.

SATURDAY, OCTOBER 13, 1894.

"THE PAMIRS."

ONE of the most remarkable journeys of which we have recent record, is that undertaken by the Earl of Dunmore through Kashmir, Western Tibet, Chinese Tartary, and Russian Central Asia. The record is in two volumes, published by Murray. For a great part of this most adventurous journey Lord Dunmore was accompanied by Major Roche. The journey was made in the winter, and the travellers sojourned at such high elevations, and traversed such lofty passes, that Mont Blanc and the Matterhorn seem mere hills in comparison. Lord Dunmore is a keen sportsman of the better sort, one loving the sport rather than the slaughter. Unfortunately, neither he nor his companion were naturalists, and thus a grand opportunity was lost. Nevertheless, a few incidental remarks are valuable as showing the great altitudes at which even flowering plants may be met with. It is true there is constant complaint as to the wayward action of aneroid barometers, so that the heights given cannot in all cases be literally depended upon, but even as approximations they are valuable. The book is one which we recommend to the lover of adventurous narrative, and to those desirous of obtaining some information on one of the least known regions of the earth; but as interest in the book, so far as this journal is concerned, centres in the plants, we shall content ourselves by making a few extracts from it. The first extract relates to a Cypress which is certainly not C. macrocarpa, a Californian species, but probably C. torulosa. Unfortunately, neither of the travellers collected even scraps of the plants they met with, so that it is not possible to know what they are writing about.

"At Chanagund, on the frontier of Baltistan. . . . after some hours of this wilderness, it was a certain relief to the eye to pass through a grove of the Cupressus macrocarpa, for, small and stunted as they were, yet anything green was welcome, and these Cypresses can never be ungraceful." p. 74.

Here is an account of the origin of evergreen trees, somewhat different from that which a naturalist would propound!:—"In regard to the doctrine of Immortality, the Tibetans have a curious legend, in which they thoroughly believe. An angel once brought a pitcher filled with the 'Water of Life' (Doortshey-i-choo) down to the earth. One man drank a little of it, and in consequence, although he grew old and infirm, he could not die. The angel seeing this, returned to heaven and reported the circumstances to the Deity, who came to the conclusion that immortality was not suited to this world. So he ordered the angel to remove the 'Water of Life,' and the angel fearing if he

*

emptied it out, some animal might drink it, took the pitcher containing the water to the top of a Fir tree, where he fastened it to a branch and left it. A little while after some crows began to peck at the pitcher and broke it, and spilled the 'Water of Life' over the spines of the Fir, which became from henceforward evergreen; at the same time the crows' beaks were also splashed with the 'Water of Life,' the result being that a crow's lifetime extends over hundred years."

We now give two passages showing the great altitudes at which vegetable and insect life may exist:—

"We were now near Changlung, West Tibet, at an altitude of 17,000 feet, and all among frozen rivers, frozen lakes and glaciers, the whole way for miles; therefore I was much astonished at finding flowers growing all amongst ice, snow, and gravel. I passed four species: one was a small purple Foxglove (?); another was so like a Violet, that I mistook it for one; the third was a blue Daisy, and the fourth a sort of yellow Cowslip. I dismounted, and gathered one of each as a specimen, but was so disgusted with the exceedingly nasty smell that one of them had, that I took no further interest in them."

In the vicinity of the Karakoram Pass, "He (Major Roche) appealed to me as to whether I had ever heard of such a thing as a Painted Lady at an elevation of 17,380 feet above the level of the sea, but as I was not aware that there existed any such a thing as an altitudinal limit to the peregrinations of these fascinating females, I held my peace and awaited the elucidation of the mystery, which was cleared up by his saying he had gone out in search of entomological specimens with his butterfly-net, and this "Painted Lady" was the name by which a certain gaudy butterfly was known to those conversant with that interesting science."

"It was in picking up one of these dead birds (in the same neighbourhood) [pigeons], that I saw growing under a rock a very pretty little mauve flower with purple petals, a yellow centre, and a small green leaf; close to these flowers were masses of light green velvety mosses. We took the altitude in which these flowers were growing, and it was 17,680 feet."

In making the ascent of the Terek Pass in the Alai Mountains, extreme cold was experienced. Here the temperature has been "constantly known to fall as low as 40° below zero F., yet here about 3000 feet from the summit (14,430 feet), the author met" stumped (*sic*) Pines growing out of the rocks which tower on either side of the Pass. At 4000 feet from the summit the trees were larger and of various kinds, mostly of the Juniperus, Cedrus, and Cupressus tribes. I stopped to examine some of them minutely, as I was anxious to discover what they were, but found they were mostly strangers to me. Altogether I should say there were seven species, the first bearing a very close resemblance to the Thuiopsis borealis (?), the second a decided Cupressus, much resembling Cupressus macrocarpa (?) (probably C. torulosa); the third a Cryptomeria, something like the japonica; the fourth a Taxodium of sorts (*sic*); the fifth a Cedrus, not unlike the Deodara of the Himalayas; the sixth a wild, straggling Juniperus; the seventh an Abies, so like the Abies canadensis or Hemlock Spruce, that I classified it as such in my mind" [probably Tsuga Brunoniana].

That is a sort of extract to irritate the botanist, for the exact determination of these Conifers would be a matter of very great interest in many ways.

The entire journey from the Punjab to Andijan in Russian Turkestan amounted to about 2,500 miles, over forty-one mountain passes, crossing sixty-five rivers, in Kashmir, Baltistan, Ladak, Western Tibet, Chinese Tartary, Sarigol, the Pamirs, to Ferghana.

Arrived in Russian territory, Lord Dunmore experienced the greatest kindness and hospitality from the Russian officials. At Marghilan he found even in that remote place a tailor to provide him with evening dress, and once more was subjected to the ways and manners of civilization. Lord Dunmore was the guest of General Karalkoff, whose name is well-known to plant lovers. Of him we are told:—"The Governor is a great gardener, and besides being the happy possessor of a marvellous collection of Roses, has a very good assortment of Coniferæ and other ornamental trees in his beautiful and well-kept garden and grounds round the house. So I spent the whole of the following morning with him in his garden and forcing-houses. His collection of Roses, I should say, was unique, comprising, as it does, considerably over a thousand different varieties."

Among the trees, Lord Dunmore mentions the Paulownia as a stranger, but that tree is not very uncommon in British gardens, though it only flowers in hot summers; and some of the Parisian streets are lined with it.

New or Noteworthy Plants.

PHYSALIS FRANCHETI, *Mast., sp. nov.** (fig. 57).

This is a relatively gigantic species of Bladder Cherry, the seeds of which were brought from Japan by Mr. James H. Veitch. As will be seen by the engraving, this is very closely allied to the European P. Alkekengi, so closely indeed, that M. Franchet in the *Enumeratio Plantarum in Japonia sponte crescentium*, vol. ii. (1879), p. 454, describes it as a variety of P. Alkekengi, but without attaching any name to it. Botanically, there can be no question that it is an offshoot from P. Alkekengi; nevertheless, for garden purposes it is abundantly distinct, and that being so, it will tend to avoid confusion by giving it a distinct name. It differs from P. Alkekengi in being an unbranched annual not a perennial, with a fibrous root, with erect branches, not creeping at the base, glabrous instead of setose, in its much larger size, in the leaf-stalks being considerably shorter in proportion to the blade than in P. Alkekengi—all points separately of minor importance, but which for garden purposes give it a distinct value. It is very striking in appearance (fig. 57), and the Cherry-like fruit is edible, though some practice is wanted to make it palatable!

It was shown by Messrs. Veitch at the Royal Horticultural Society on Tuesday last.

P. Alkekengi is a native of Central Europe, the Levant, Persia, Turkestan, China, Corea, a fact, which of course strengthens the notion that the present plant is a direct offspring from Alkekengi.

Alkekengi is said to be derived from the Arabic name for the plant. *M. T. M.*

Lupinus fallax, *Greene, Erythea*, ii., 119 (July 2, 1894).

This makes a finely ornamental bush, being from 3 to 5 feet high, of neat, symmetrical outline and silvery foliage, bearing in the flowering season an abundance of spikes of violet-coloured flowers. A good supply of seed has been obtained this summer from the type-plant, which will be available for exchange in the fall. The description, copied from *Erythea*, is as follows:—

Shrubby, 3 to 5 feet high, branching from above the base of the trunk-like stem, the branches ascending; branches, foliage, and inflorescence, all silvery, with a velvety-silky pubescence; stipules linear-subulate, ½ inch long or more, deciduous; petioles hardly as long as the seven to nine linear-lanceolate acute leaflets, these 1½ to 2½ inches long; racemes distinctly peduncled; bracts slender, straight, very long and conspicuous before flowering, caducous; flowers distinctly whorled; banner and wings about equal, the latter deep violet, the former with middle portion white, changing to red; keel woolly-ciliate above the middle; pods spreading, velvety, about six-seeded; seeds small, dark-coloured, scarcely compressed. . . . Its only known habitat is Mount Tamalpais, west of San Francisco Bay.

Lupinus Micheneri, *Greene*, l. c.,

is an herbaceous perennial Lupine of prostrate, spreading habit as regards foliage, quite pretty in the spring and early summer, though the flowers are not very ornamental, turning, soon after opening, to a dull purplish or brownish-green. It is from Fort Bragg, Mendocino co., Northern California, and is named after its collector, Mr. Charles Michener.

Delphinium Emiliæ, *Greene*, l. c., 120.

This is one of the dark blue species, 1½ to 2 feet high, near to D. hesperium and D. variegatum; it would make a pretty addition to the perennial border. In its native haunts—open, sunny slopes of Knight's Valley, Sonoma co., Middle California—it is found in full flower in the middle of June, and, along with the large and handsome Calochortus luteus var. oculatus, and a showy species of Eriophyllum, makes a very pleasing sight.

Eschscholtzia cucullata, *Greene*, l. c.,

is a remarkable species, which will make a useful addition to the garden if seed can be obtained in sufficient abundance for distribution, but here it proves very shy at maturing seed, and I have failed to collect any up to the present. When young, the leaves are strongly cucullate-incurved, and this character being more or less retained in age, gives a compact, tufted appearance to the plant. The flowers are borne on long, depressed branches, are somewhat small for the size of the plant, and approach true californica in colour. Professor Greene describes them as lemon-yellow, with orange spot at base. The pods are remarkably stout towards the middle. This is another of the plants brought from Fort Bragg by Mr. Michener.

The other species described by Professor Greene in the above-mentioned number of *Erythea* are Hemitomes pumilum, Stachys velutina, and S. stricta. *J. Burtt Davy, University of California, Department of Botany, Berkeley, California.*

* *Physalis Francheti*, Mast., sp. nov.—Annua, bipedalis et ultra robusta glabrescens, caulibus erectis, nec basi repentibus, crassitie pennæ cygneæ, ad nodos valde incrassatis, vix ramosis, prominenter angulatis; foliis amplis longe petiolatis, petiolis 4—5 cent. long, comparate brevioribus quam in P. Alkekengi, laminis amplis 10—13 cent. long. 7—8 cent. lat., ovatis abrupte acuminatis sinuatis basi sub rotundatis seu cuneatis; calycis tubo imprimis cylindrato, sepalis oblongis obtusis; corollâ diametro fere pollicari, albo-flavescente late aperta rotata; antheris luteis; pedunculo fructifero 5 cent. long, glabro; calyce accrescente pallide rubro-aurantiaco, circa 6—7 cent. long, 6 cent. lat. et ultra valde inflato, 5 angulato, angulis subalatis nervis intermediis minoribus, ovato vel suborbiculari basi intruso; fructu globoso magnitudine cerasi, aurantiaco.

Vidi specimina exsiccata a cl. Bisset et a Maximowicz lecta nec non plantas in hort. Veitch cultas e seminibus a Japonia a cl. J. H. Veitch allatis.

Fruit Cultivation in Cornwall.

Conspicuous among the county gentlemen is the Rev. J. Daubuz, of Killiow, Kea, Cornwall, who loses no opportunity of gaining and circulating sound practical instruction by means of lectures and experimental planting on his own estate. Recently Mr. Daubuz paid a visit to Messrs. Bunyard & Co.'s nurseries at Maidstone, where over 100 acres are devoted to the production of all the best and most approved varieties of fruits, many of them carrying fine samples. M. Daubuz secured numerous samples of the best and most suitable sorts to grow for market. On their arrival at Killiow he invited the neighbouring gentlemen and all interested to come and inspect the Kentish samples, and at the same time to bring with them any good samples of fruit grown by themselves. Saturday, September 1, at 4 P.M., was the time fixed for this novel fruit conference. Unfortunately, the great pressure of harvest operations prevented many from

attending, but those who were able to be present enjoyed a great treat. Amongst those who attended were Mr. Davies Gilbert (who sent numerous and very fine samples of Apples, Pears, and Plums), Mr. John Magor, Mr. John Gunn (who brought samples of Plums from Coombe), Mr. T. Gunn, and Mr. Sangwin of Trelissick.

Mr. Bunyard's contribution consisted of fine specimens of various varieties of Plums, and Mr. Daubuz had samples from his own gardens, which altogether formed a good collection of choice fruit. The whole were arranged on tables in a tent in front of the mansion, and the fruits were all correctly named. After closely inspecting the fruits and discussing their respective merits, the host escorted the party through the richly-stocked gardens and grounds of Killiow, special interest being taken in the experimental grounds, planted last winter. Each visitor was presented with a printed list of all the sorts and varieties planted. Among the Apples were Cox's Orange Pippin, Cox's Pomona, Bramley's Seedling, Ecklinville Seedling, Lane's Prince Albert, Lord Grosvenor, Lord Suffield, and Warner's King. Cherries were represented by Amber-heart, and Werner's Black-heart; Pears by Pitmaston Duchess, Beurré de Capiaumont, Doyenné Du Comice, Williams' Bon Chrétien, Beurré Diel, Marie Louise D'Uccle, Louise Bonne of Jersey, Winter Nelis, Gansell's Bergamot, Bishop's Thumb, Vicar of Winkfield, Clapp's Favourite, Souvenir du Congrès and Hazel; Plums by Rivers' Early Perfection, the Czar, Victoria, Pond's Seedling, Pershore, Coe's Golden Drop, Green Gage, Belle de Louvain, King of Damsons, and Prune Damson.

Each variety was represented by from ten to twenty trees, forming a very choice collection in perfect health, some of them heavily laden with fruit—too much so, perhaps, for the first year. Though the proprietor said he had thinned them considerably in the spring, some thought the trees a little too long in the leg for such a stormy county as Cornwall. *Pomifera. Extract from Cornwall Gazette.*

ARACHNANTHE MOSCHIFERA.

Our illustration (fig. 55) gives a representation of this singular "spider flower," the species on which Blume founded the genus, and which was exhibited by Messrs. Heath & Son, of Cheltenham, at the Royal Horticultural Society's meeting of the Orchid Committee on August 14, when it was awarded a Botanical Certificate. This singular Malayan Orchid is like a Renanthera in habit, and its pungently-fragrant flowers, which are greenish-white blotched with reddish-chocolate, are very singular in form, and are produced in succession from the same spike for a considerable period. It should be grown with Aërides, Vandas, &c., in the warm house.

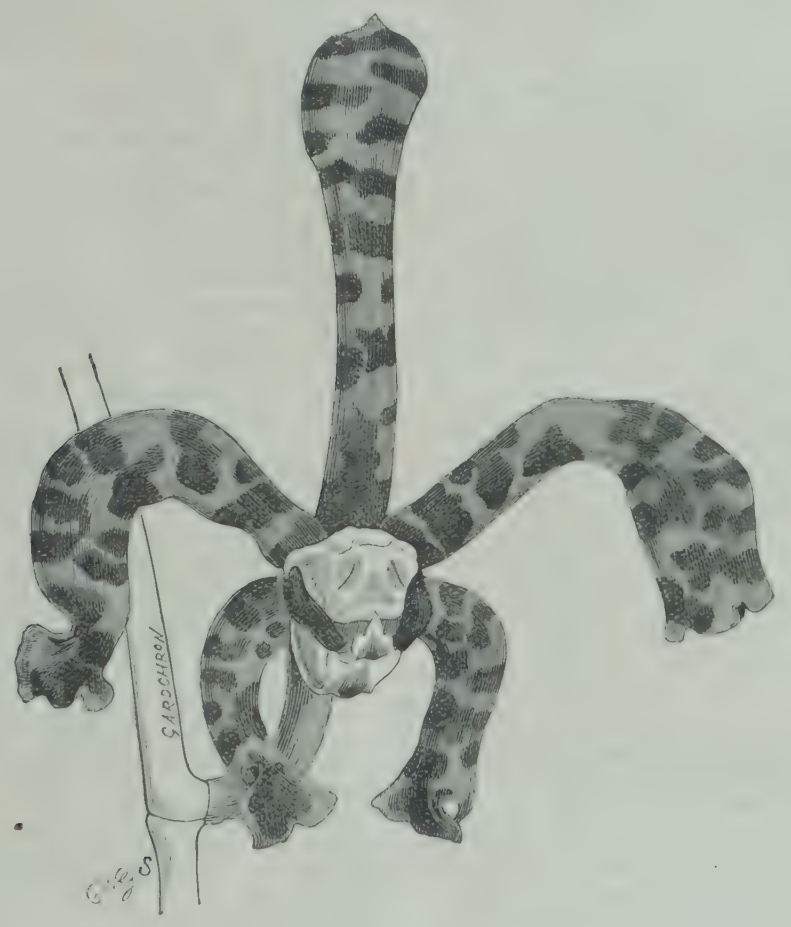

Fig. 55.—Arachnanthe moschifera.

A TRAVELLER'S NOTES.

(*Continued from p.* 401.)

The Sydney Botanic Gardens.—The exceeding beauty of the natural situation of the Sydney Botanic Gardens is proverbial. Covering 44 acres of ground, they are surrounded on three sides by the imperial domain of 150; whilst the fourth, the southern end, skirts Farm Cove, and affords a fine view of the low hills and wooded bays of Port Jackson. The whole extent is divisible into three main portions, the original garden, the grounds devoted to the exhibition of 1879, since added, and a large moon-shaped curve reclaimed from the bay, opposite the anchorage of the British fleet.

Most, especially of the last two named portions, is under Buffalo Grass or Buffalo Couch mixed; though highly ornamental, it cannot be recommended for tennis or cricket purposes.

The main entrance faces due north; it is but a few yards from the private gate to Mr. Moore's house, the office with Bougainvillea-clad walls, and the museum. The walks are either tarred, asphalted, or gravelled, the two former being employed to a very large extent, as much from motives of economy as to prevent the destructive effects of the wash of sudden and heavy rains.

Tarring is the simplest, but it is apt to wear away, and frequently cracks; whereas, asphalt, carefully applied in three layers, will stand for many years, and bear the weight of heavy carts. The gardens and glass are clean and neat, and the luxuriant vegetation in the borders kept within bounds. To attain this end, Mr. Moore finds it necessary to remove hundreds of cartloads of thinnings annually.

Within a few yards of the main entrance are two long beds of shrubby Euphorbias, Phyllocactus, Cereus, and Opuntias, divided by a smaller one, devoted to Strelitzias. Statuettes line the path, and a handsome fountain, a private gift, reaches to one edge. On either side are long beds of flowering perennials, &c. Phloxes, Antirrhinums, Vincas, Bouvardias, Poinsettias, Tea Roses, Cannas, Statice, Iris florentina, and various Sunflowers. On and scattered about the lawns behind are various single specimens, Robinia pseudo-Acacia, Grevillea robusta 40 feet high, Pinus pinea of still greater dimensions, a good English Oak, and the well-known Metrosideros tomentosus. Mr. Harwood, the superintendent, considers it when in flower one of the handsomest shrubs in the garden.

Near a Ficus rubiginosa, retaining its foliage longer and hence more suitable for gardening purposes than F. macrophylla and other species, is a good regular well-formed specimen of the Queensland Tristania conferta. A good Madagascarian shrub, largely represented in the garden, is Astrapæa Wallichii, bearing long, flexible, pendent stalks, with heads of rose-coloured flowers, which emerge from the stem amid the handsome cordate foliage, which is often of great size.

An isolated specimen of Taxodium mexicanum retains its foliage throughout the winter, being superior to T. distichum in this respect.

At the lower end of the old garden are two rows of broad oblong beds, containing many hundreds of interesting trees and shrubs.

Meryta is naturally one of the most striking genera in the borders. M. undula and M. macrophylla from the South Sea Islands, M. Sinclairii from New Zealand, and M. latifolia from Norfolk Island, are amongst the best representatives of the genus—the latter with huge obovate leaves, 1½ to 2 feet in length, aggregated in masses at the end of the branches, is very noticeable. Theophrasta imperialis, a specimen some 25 feet in height, has even foliage of greater size, thick, coriaceous, and closely set—an imposing plant. Toxicophlæa spectabilis is often met with, at this season, crowned with innumerable fruits of the size of a pigeon's egg, and flushed with red. Jacaranda mimosæfolia is at home, a broad spreading piece, the ground round its base in the flowering season being described as blue with fallen blossoms. Franciscea are numerous and good. Near a F. eximia is a noble Camellia facing Magnolia grandiflora, an even, well-formed specimen, 35 feet high; in the same border M. acuminata is full of bud, also Rogieras and Rondeletias, the various species represented by tall bushes, flower freely.

Hippomane spinosa, from tropical America, is noteworthy on account of its long, sinuate, deeply-serrated foliage; in its vicinity, Brexia spinosa from Madagascar, and Viburnum Tinus from the south of Europe, are in full vigour. Such a vivid contrast is not the only one. In an adjacent border, within 50 yards, is an Elm close on 80 feet high; Arabian Coffee, loaded with berries; a Lime, Mango, Chestnut, and common Laurel. The individual waxy-white blossoms of Franciscea americana are good, but the invariably-sickly appearance of its foliage is against it. Tabernæmontana dichotoma is a fine thing; several bushes in various parts are from 8 to 12 feet in diameter; thousands of buds nestle amongst the large decussate foliage of the richest hue, but a few have as yet developed into the large white fragrant flowers. Gardenia Thunbergii, not unlike it in general aspect, though its individual blooms are far larger and finer, is also to be seen. Mr. Harwood finds it a most useful stock for the other species. A good flowering shrub is Chænesthes (Jochroma) gesnerioides; although now in its second growth, it is bearing many hundred bunches of brick-red tubular blooms. Vangueria velutina, from Madagascar, has fruit about the size of, and not unlike a Date. A small-foliaged, thick-set shrub from the Mauritius, Eugenia buxifolia, is neat and effective, though its individual foliage is dwarfed by the large Randia macrophylla, and the Queensland species, Randia Fitzalani, both magnificent shrubs. A curious tree is a species of Schizolobium from Brazil, with bare stem and branches tipped by a few bipinnate leaves, each 4 to 5 feet in length. Erythrinas are various, numerous, and good; a plant of E. indica, its stem's diameter 2 feet, should be magnificent in a few months' time. The graceful

drooping foliage of Panax elegans makes it as effective as in the Hong-Kong Gardens, where it may be seen in similar perfection. All species of Arbutus grow with great rapidity; one, A. canariensis, freely fruiting, is now over 30 feet high—a noble bush. Aleurites triloba, another great tree of the Hong-Kong Garden, will ever be difficult to beat for landscape work. Monodora Myristica and Eugenia Moorei are both handsome shrubs; whilst the Indian evergreen Quercus incana, with long oval foliage; Xylophylla angustifolias, a mass of bloom; Coprosma Baueriana, from New Zealand; Nephelium Litchii, growing, but not fruiting well; the Queensland Brassia actinophylla, and Tripidanthus calyptratus, from Bengal, are equally interesting. Stenocarpus sinuatus grows to 80 feet; apart from the large circular heads of brilliant scarlet, the deeply-lobed foliage is in itself ornamental. Populus alba attains 100 feet, a truly fine tree; P. nigra, still higher; P. angulata and P. betulifolia are also represented. The Bombax is at home. Kentia Canterburyana is found in the shade on Lord Howe's Island, resisting the sun but poorly, but during the winter months picks up considerably. Aralia Veitchii, 30 feet in height, is a good tree, with a round even head of rich, glossy, lobed foliage.

Amongst New South Wales trees, very many of which are naturally represented, I noted Achras australis—its fruit like a large Plum in all but its fitness for human food; it has handsome oval foliage 6 to 8 inches long. Tarrietia is also a fine native genus—the sp. Argyrodendron and Achinodendron in particular. The long pinnate foliage of Dysoxylon Muelleri, the pencil Cedar, the creamy-white long stamened blossoms of Capparis nobilis, Sterculia lurida, good, though not equal to the Flame-tree; Sterculia acerifolia, which, when entirely deciduous, bears at the end of the shoots racemes of brilliant scarlet tubular flowers, are all noteworthy.

Liquidambar styraciflua does well, and Streptosolon Jamesonii in a neighbouring border exhausts itself in a few years with the rapidity of its growth. A rare tree is Sciadophyllum actinophyllum from New Caledonia. Quercus suber is represented by several good-sized specimens, though Q. virens is found to be the most rapid grower of the genus; a Q Ilex, near the Lily bank is, however, very fine, and of exceptional size. As planting trees for general purposes in this colony, Mr. Moore considers the two last-named valuable. The large white flowers, 3 to 4 inches in diameter, of Pterospermum acerifolium, surmounting broad handsome foliage on young stems clothed in down, may now be seen. The giant Nettle tree from East Australia, Laportea gigas, with foliage over 10 inches across, is showy. Catalpa speciosa does well, too well, in fact, and is accordingly clipped within bounds annually; Escallonia montevidensis is in the same condition, it is difficult to estimate its probable dimensions, as it is relentlessly cut every winter—just now its tall bushes are a mass of white bloom. Turning from the older portion towards the steps leading to the Palace Garden, the Palmetum, the Dammaras, and Araucarias (described later), are passed. Amongst the Conifers planted in this direction are Abies firma, Nordmanniana jezoensis, Smithiana, Torreya grandis, Sciadopitys verticillata, a fine specimen 20 feet high; Podocarpus bracteolata from the South Sea Islands, Frenela Macleayana, a beautiful mass of pale slender foliage, Podocarpus dacrydioides, from New Zealand, and P. cupressina, from Java, their foliage more resembling Taxodium than Podocarpus; and many others. *James H. Veitch.*

(To be continued.)

OUR FRUIT SUPPLIES.

Within the last two years the Board of Trade has began to analyse more carefully our imports of foreign fruit, and hence we are able to arrive at a tolerably correct classification of the various kinds we receive from abroad, which were formerly lumped together. Oranges and Lemons, Cherries, Plums, Pears, and Grapes, are now separately enumerated, so that we can form a more correct idea of the competition which our home fruit-growers have to contend with.

Even as far back as fifty years, our trade returns were more carefully kept and methodically published, and the classification more distinct. For this there was probably a reason, in that a duty was levied on most kinds of fruit, but the heading of "other articles" has long since been swept away, from which even such minor articles as Medlars, Quinces, Cranberries, &c., could be traced as to quantities.

The sums we have paid for foreign-grown fruit at decennial periods have been as follows:—

	£		£
1860	1,900,000	1880	5,500,000
1870	2,200,000	1890	7,287,000

If we take the estimate at other periods, we find the classification as follows:—

	1845.	1855.	1865.
	£	£	£
Apples, Oranges, and Lemons	158,098	658,197	1,131,183
Nuts, Almonds, &c. ..	80,683	314,231	424,861
Currants, Raisins, Figs, dried, &c. ...	648,108	1,108,454	1,629,935
Unenumerated ...	.....	20,151	128 925
	886,888	2,100,836	3,314,879

	1875.	1885.	1893.
	£	£	£
Apples, &c.	1,341,704	2,198,041	2,550,155
Nuts, &c.	584,525	701,910	.....
Currants, &c.... ...	2,794 047	3,265,825	1,635,172
Unenumerated ...	1,614,973	1,421,747	1.849,715
	5,840,249	7,587,523	6,035,042

Let us trace the progress made in the imports of individual fruit, taking only the temperate-grown fruits. Some of these, from the absence of reliable data, we cannot compare.

In 1855 we imported only 210,513 bushels of Apples, and the Continent of Europe was then our chief source of supply, North America sending us only 17,000 bushels. There was then a duty levied of 2*d.* or 3*d.* a bushel, according as they were from foreign States or British Possessions. Up to 1881, in the official returns, Apples were included under the head of "Raw Fruit Unenumerated;" since then they have been separately given, and the annual imports show as follows:—

Year.	Bushels.	Value £.	Year.	Bushels.	Value £.
1832 ...	2,388,805	783,906	1888 ...	3,796,592	1,030,160
1833 ...	2,251,925	553,488	1889 ...	3,612,316	974,405
1884 ...	2,479,870	786,415	1890 ...	2,574,957	786,072
1885 ...	2,337,685	717,031	1891 ...	3,147,373	1,033,997
1886 ...	3,261,460	857,095	1892 ...	4,514,700	1,353,812
1837 ...	1,944,460	563,919	1893 ...	3,463,917	844,312

Our supplies are now chiefly drawn from North America. Canada and the United States are running a race as to which can send us the largest quantity.

In 1892 Canada sent us 1,259,000 bushels, and the States 1,750,443 bushels. The separate returns for last year have not yet been issued. But three-fourths of our supplies of this fruit now come from America. From small beginnings of about £50,000 in value, the export trade in Apples from the States has risen to over £520,000.

In 1890 the United States exported also 21,000,000 lb. of dried Apples, value £210,000, chiefly to the continent of Europe. In France they also carry on a large trade in drying Apples, which are used in the restaurants in compotes and stewed fruits.

Canada has also entered into this trade, having exported 257,000 lb. of dried Apples in 1892. The Apple crop can only be depended on in alternate years. Australia has recently put in an appearance in the supply of Apples, and Tasmanian and other kinds are now common in our shops.

In the Rhine districts, Apples and Pears are cut into pieces and strung on pack-thread. They are then hung up to dry, and serve as vegetables to eat with roast meat or with pancakes through the winter. In America also, Apples for domestic use are first peeled or pared (by machine, in most cases) and cut into four or six pieces, strung upon lines, and hung up to dry; they keep for any length of time. By putting these dried parts of Apples along with a little boiling water and sugar, a delicious dish is readily obtained, equal in every respect to stewed Apples. For the sedentary man, the use of fresh fruits becomes a necessity.

The Peach and the Apricot are not extensively grown in this country, but in North America the export of canned Peaches reaches about one and a quarter million cases (each of twenty-four tins), using about fifteen million bushels of fruit. The value of the export of canned fruits was averaged, in the four years ending with 1891, at £160,000.

Fruits of various kinds form a very pleasant and wholesome part of human food, and wild and cultivated fruits are largely consumed by different people, both in temperate and tropical countries. There is nothing in which Nature has been so bountiful to man, in whatever climate he may be found, temperate or hot, as in the supply of fruit.

The importance of Apples as food has not hitherto been sufficiently estimated in this country, nor understood. Besides contributing a large proportion of sugar, mucilage, and other nutritive matter, they contain such a fine combination of vegetable acids and extractive matter, as to act powerfully in the capacity of refrigerants, tonics, and antiseptics; and when freely used at the season of ripeness by rural labourers and others, they prevent debility, strengthen digestion, correct the putrefactive tendencies of nitrogenous food, avert scurvy, and probably maintain and strengthen the powers of productive labour.

Cherries. In 1885 we imported but 18,055 bushels of Cherries; last year we received 346,148 bushels from abroad, besides those home-grown.

Of Plums we imported 413,000 bushels from the continent in 1892, and nearly double that quantity last year.

Of Grapes we imported but 7000 bushels in 1855, and last year we received 978,500 bushels.

Of Pears there were no imports in 1855, and we had to be contented with a couple of hundred bushels of dried Pears; last year we received 915,000 bushels, in addition to those grown at home.

It is not necessary here to speak of berry fruits, nor of Currants, Gooseberries, &c., of which our home supply is sufficient. The import of tropical fruits and nuts I may touch upon on some future occasion. *P. L. Simmonds.*

FOREIGN CORRESPONDENCE.

SOUTHERN CALIFORNIAN NOTES.

Referring to Lathyrus splendens, which has flowered recently in the Isle of Wight, it seems strange that so splendid a plant should be so little known. Here, in California, one hardly ever sees it; owing however to the enthusiasm of a few amateurs, attention has been directed to it lately, and so we may hope to see it oftener. In the writer's garden it came into flower the second year from seed; little water is required during summer, as naturally growth occurs during cool weather, when the rains occur, the flowering-season being early spring, extending over a period of two months with us (other cultivators report some variation from the above). I suspect perfect drainage, moderately light warm soil, and a sunny situation are indispensable conditions; cold damp soil being likely to cause the destruction of the roots during the dormant period. In most instances, under cultivation, seed is produced very sparingly, while the wild plants are so scarce in California proper, that we may say that seed is not to be procured in any quantity. In the peninsula of lower California, the plants are reported to be more abundant. I suspect seed of L. coccinea, an inferior species, is what is most often offered for L. splendens. As it is with the Lathyrus, so it is with a number of charming native plants, they are almost unknown here in gardens; such, for instance, as Romneya Coulteri, Dendromecon rigidum, and the charming little Heath-like shrub, Gilia californica, the latter often seen in its native wilds completely covered with satiny-pink flowers.

Lately, our local horticultural society has procured the use of a tract of suitable land, on which

water has been piped, and the nucleus of a botanical garden has been started. About 150 species have been planted, including the following Palms: Livistona australis, L. sinensis, Chamærops excelsa, Washingtonia filifera, Phœnix canariensis, Cocos australis, C. plumosa, Jubæa spectabilis, Erythea edulis, E. armata, and Sabal palmetto. Later, as tree growth is acquired, Seaforthias and Kentias will be added, both doing fairly well when protected by trees. A number of interesting trees have also been planted, such as Persea gratissima, Anona Cherimolia, Casimiroa edulis, Eugenia jambos, Calodendron capense, Castanospermum australe, Aleurites triloba, and others. It is also intended to make, as far as circumstances will permit, a feature of the most attractive species of the native flora.

Looking about gardens, one sees, among a few striking things, some plants of Eucalyptus ficifolia in flower; some are of a rich crimson, while others, as noted and compared, are an orange-scarlet—a tree in full flower is certainly a fine sight. Jacaranda trees are especially fine this summer, being well covered with large trusses of pale purple flowers. With us, growing in the open, Murraya exotica, Stephanotis, Schubertia grandiflora, Passiflora princeps, Crinum Mooreii, and Michelia fuscata have been much enjoyed this season. *J. C. Harvey, Los Angeles, California, August* 1, 1894.

Truffles.

On Monday, September 10, M. Chatin communicated to the Academy of Sciences, in Paris, the results of his investigations relating to two kinds of Truffles, lately forwarded to him for identification by M. Hanotaux, the Minister for Foreign Affairs. The Minister had just received them from the Resident-General at Tunis and the French Consul at Tripoli. The Truffle found in Tunis has turned out to be the Terfezia Claveryi, a species already described by M. Chatin, and named by him after M. Clavery, who had sent them from Damas, when he was Director of Consulates.

The second specimen, from Tripoli, also belongs to a species not unknown. M. Chatin identifies it with the Terfezia Boudieri of Algeria and Arabia The Truffle from Tunis was accompanied by its *plante nourricière* (foster-mother), a very small kind of Cistacea, designated by the inhabitants by the name of "Arong Terfas," or root of Terfas.

In Tripoli and in Tunis, as also in Algeria and Arabia, both these sorts of Truffle, without taste or smell, are consumed daily. Did they possess the aroma and taste of the much-prized Perigord Truffles, they could only be eaten now and then. It might be worth while for some of our Covent Garden dealers to import them for stuffing turkeys, &c, next Christmas-time. With a little Mushroom ketchup, these tasteless Truffles would prove uncommonly good substitutes for the more expensive French Truffles, whilst they can be procured in large quantities. *S. Pasfield Oliver, Capt.*

THE ROSARY.

SINGLE ROSES.

The demand for these increases, and when we call to mind the beautiful collections staged at the various exhibitions of the National Rose Society, there can be little wonder at their increasing popularity. If we include a few of the semi-doubles, it is quite possible to have a charming and varied collection without any of those usually classed among the exhibition varieties. I am not contemplating any derogatory remarks against the double kinds, but I wish to draw more general attention to the natural grace and beauty of many singles.

Our own native Briars are simply exquisite, varying as they do in colour and form. What can possibly be prettier than Paul's Single White, Hebe's Lip, Lowe's variety of Rosa indica, R. rubrifolia—with its deep-coloured growth, Rosa macrantha, and Paul's two newer introductions Allister Stella Gray and Carmine Pillar? All of these are excellent; but we are now favoured with a new departure, and one which seems likely to develop into a very numerous class. I allude to the hybrid Sweet Briars raised by Lord Penzance. We all accord praise to the soft beauties of colour and perfume belonging to the best type of our Sweet Briar; but here we have the perfume intensified, vigorous growth, and the bushes are so free in blooming that the whole presents one sheet of colour. I had heard a good bit about their wonderful growth, but scarcely expected to find such remarkable vigour. About the middle of June I saw Messrs. Keynes, Williams, & Co.'s collection at Salisbury, and was most agreeably impressed with their beauty and health.

I think it was in 1892 that a grand collection of these was shown at the Crystal Palace. All who

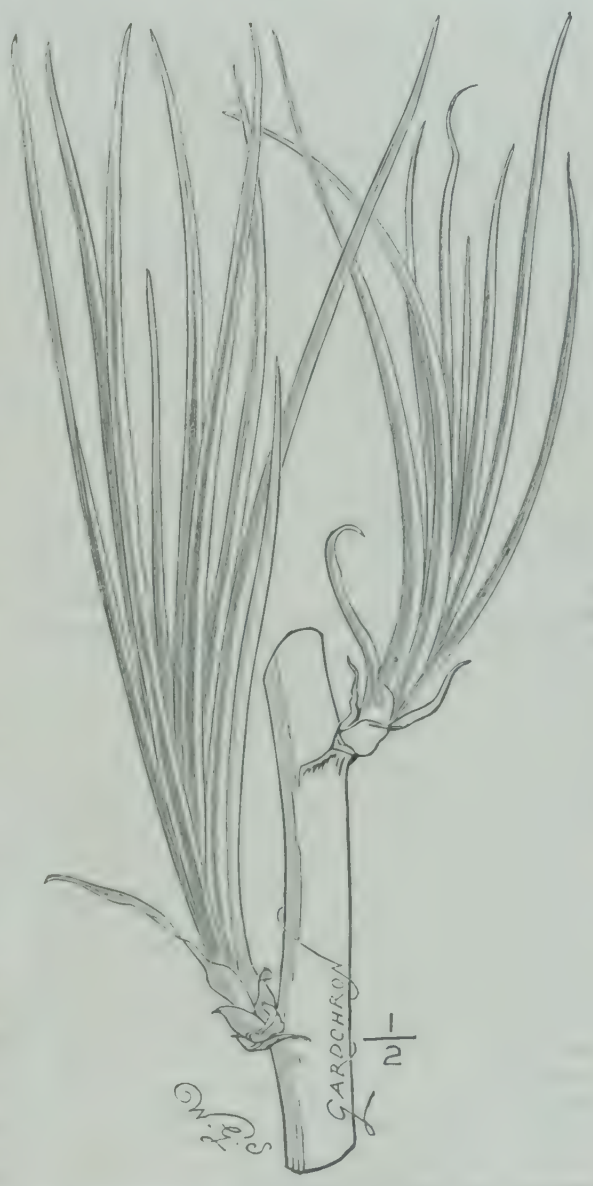

Fig. 56.—Kniphofia, adventitious buds from flower-stalk.

saw, admired; but it is not everyone who can form an idea of their growth and beauty, unless favoured with an invitation to view them in a state of nature. Messrs. Keynes & Co. have worked up a large stock, and evidently expect a brisk demand. They are worth it, and one can hardly plant them in the wrong spot. Of how few new Roses can we say the same? Lady Penzance is evidently a trifle earlier than the remainder, a point probably derived from its being a cross with the Austrian Copper, itself one of our very earliest Roses. There is a distinct shade of coppery-red, and that peculiar metallic lustre retained in this cross. A distinct halo of bright yellow in the centre of the flower has a very pretty effect when seen through the deep golden anthers. This and Lord Penzance are among the sweetest, both in flower and foliage. Lord Penzance is soft fawn, with a clear yellow centre; some of the blooms were shaded with a delicate pink. Lucy Ashton, a white variety with pink edges, also carries a large number of showy hips; the blooms are a little smaller than the remainder, but the whole plant is very taking. A beautiful bright crimson is found in Anne of Gierstein a wonderful grower with large foliage, of the Bourbon class, but with all the perfume of Sweet Briar, and one of the largest flowers in the whole collection. Meg Merrilies is more of a scarlet than crimson, and was growing some 12 to 15 feet high; it is simply beautiful. A third deep-coloured variety was named Isabella Wardour, a kind not catalogued by the raisers, but one we are sure to require later on; it is almost a perpetual bloomer. For the matter of that, I believe these new Briars will be more perpetual than the majority of our single Roses, which, unfortunately, only give us one good crop early in summer. This season's maidens were blooming, and old plants were producing grand shoots from the main stems, which will probably flower during a favourable autumn. A few strong blooms are certain to be secured all through the season, while at all times the delightful perfume of our favourite Sweet Briar is present. I did not see them early in the morning, a time when this scent is most pronounced, but even at mid-day it was very prominent.

There is one more variety I must name, and which is not mentioned in the list of those to be distributed in November; that is, Lucy Bertram, a semi-double form of Meg Merrilies. I am under the impression it will not be so fleeting as the single form. A collection of nine varieties is to be distributed this season, and all gardens should at least possess the following four, Anne of Gierstein, Lord and Lady Penzance, and Rose Bradwardine.

After the severe frost at the end of May, and the heavy hailstorm early in June, I did not think to see this lovely race of Briars so completely unharmed as they were. What splendid objects of beauty they will form for a lawn may be imagined by those who saw the Crystal Palace collection of 1892, if they will picture to themselves plants 10 to 15 feet high, bushy in proportion, and as thickly covered with flower as the clusters then exhibited; indeed, I think I may safely say that they flower more freely, while the graceful half-drooping shoots have a charming effect. I will close with one word of warning. Do not prune; never let the knife touch them unless to bodily remove encroaching growths, although I venture to say that in the majority of cases other subjects will have to make way for the Briars. *Visitor.* [These cross-bred Briars should make beautiful materials for garden hedges, and bear the shears as well as the common Briars. Ed.]

KNIPHOFIA, ADVENTITIOUS BUDS.

The production of buds in unusual places is not sufficiently rare to excite much attention. In many hardy perennials the stems instead of drying up after flowering, produce leaf-buds in the autumn, and thus in a measure assume the condition of shrubs. It is, however, rare for the flower-stalk of such a plant as Kniphofia to produce any leaves beyond the bracts at the base of the flowers. In fact, the definition of a "scape" such as Kniphofia usually has, is a leafless flower-stalk. Alas for definitions! Kniphofia frequently produces buds from its flower-stalk, such are shown in fig. 56, and by means of which the plant may readily be propagated.

NEPENTHES.

Nepenthes, well grown as they are at Oakholme, Sheffield, are splendid and interesting objects for the decoration of the stove. Suspended from the roof, grown in baskets, are some nine or ten varieties, of which Mastersiana and Curtisii stand out very conspicuously. These were both sent out by Messrs. James Veitch & Sons. The former is a hybrid between the beautiful N. sanguinea and N. Khasiana, known also by the name of distillatoria. There are some half-dozen plants of Mastersiana suspended in the manner described, well furnished with from eighteen to twenty-four well-coloured pitchers on a

plant, an intense bright red. Mr. Outram tells us he measured one of the many, and its dimensions are fully 14 inches long, girth fully 11 inches, lid nearly 4 inches by 4. Of N. Curtisii there are two dozen fine pitchers, some of which are nearly 12 inches long; the pitchers are a dull green, most beautifully blotched with brownish-purple. N. Dicksoniana, N. Rafflesiana, N. Hookeri, and others are likewise well done, reflecting great credit upon the grower, Mr. Hannah, who has had charge here over thirty years.

Florists' Flowers.

SELECT JAPANESE DECORATIVE CHRYSANTHEMUMS.

It is not always easy to know what some cultivators of Chrysanthemums mean to convey by the words decorative plants, but from the notes which sometimes accompany the names of some of the varieties, it is, as I take it, the large-flowering ones chiefly. No one would dispute that these are "decorative;" but what I myself regard as coming strictly under that denomination, are plants which when grown as bushes are meant to give a large quantity of flowers rather than a few of remarkable size and fine quality. Some varieties are better adapted for bushes than others, and of these are Avalanche and W. H. Lincoln, mentioned by a correspondent some time ago. The former has numerous side-shoots on the main stems, which are really the great charm of bush plants; but in this case the flower-stems are far too short, and the result, instead of long graceful shoots clothed with blossoms, is a lot of short stemmed ones, that render the plant mop-headed and ineffective. W. H. Lincoln, late flowering, as a bush, the flowers not opening till late in December. Many persons favour bushes because they provide abundance of blooms for cutting; and a really good list of suitable varieties in all sections would be most welcome to those who have not the opportunities of judging for themselves. *E. M.*

VEGETABLE PRODUCTS OF GENOA.

The following interesting account of the vegetable products of the country around Genoa and in Piedmont, is given in a recent report on the district. Fruit is said to be very plentiful, and Peaches are wonderfully abundant, hills and valleys being in early spring all flushed with their delicate pink bloom, while Apples of excellent quality are also abundant and cheap.

The principal objects of cultivation on the surrounding hills and the lower slopes of the Apennines, and the more level ground between the foot-hills and the sea, are the Olive and the Vine, the latter being grown in this neighbourhood mostly on terraces and trellises, while in broad valleys, such as the one at the *embouchure* of the Entella, near Chiavari, the Vines are gracefully trained, according to the old Roman fashion, to Elms, Poplars, and other tall trees, and it is said that, with the higher elevation thereby attained, they yield better results. Although the Olives are small, they yield good oil, and it is said that wherever the Olive-tree grows well, people can live on the land; and as to the Vines, though they do not produce as large and luscious Grapes as those of the warmer south, a large quantity of rather rough wine is made in the district, and extensively consumed; while a good deal of dark red table wine comes from Piedmont, but the better qualities from the south, notably from Tuscany and Sicily, the "Chianti" being particularly appreciated, while excellent sparkling wines are produced at Asti. Wine to the working-classes represents the British workman's beer, and doubtless suits the climate better than the latter would do, and it is equally cheap, table-wine being retailed at about 4*d*. per quart, and it can be bought cheaper in the cask; while the burly rush-bound flasks of good red Chianti, holding about five pints each, are sold from one shilling upwards. The numerous large Chestnut woods, which clothe the neighbouring mountains, furnish an immense quantity of Chestnuts, which are extensively used as food in various forms. Pine kernels are largely consumed, principally in cakes and confectionery. In addition to the Peaches and Apples before mentioned, the environs of Genoa produce a large quantity of Cherries and other summer fruits, and plenty of the juicy "Nespole," or Japanese Medlars, which are of comparatively recent introduction. Oranges and Lemons are extensively grown, especially in the warmer and more sheltered neighbourhood of Nervi, and the former include both the ordinary Orange and the fragrant little Mandarin.

Near Genoa itself great damage is sometimes done to the Orange crop, which seems to ripen from December to April, by severe spells of cold weather, a lot of the fruit having been ruined by the severe frost with which the present year commenced. Manure is extensively used, and largely imported. Cultivation in general appears to be assiduous and thorough. Vegetables are largely grown on the lower lands, especially where irrigation can be applied, and are of fairly good quality. Green Peas grown in the open air may be eaten in December The Genoese are very fond of flowers, of which enormous and graceful bouquets and extraordinary devices are carried on various festive occasions. Rich flowers are varied and abundant, and their cultivation appears to be a remunerative industry.

Trees and Shrubs.

A VARIEGATED ELDER.

I send you some sprays of a variegated Elder which was found near here, and which competent judges considered the best they have seen. Its history is this:—Two years ago my coachman, whilst fox-hunting, saw a variegated plant in one of my woods at Shirenewton. I sent him back for it, and it proved to be an Elder; it was 12 inches high, and much variegated, the variegation being a pure white. It is now 4 feet high, and as much in diameter, the leaves smaller than the common form, and the branches much more numerous, forming a dense bush. *E. J. Lowe, Shirenewton Hall, Chepstow.*

Syringa pekinensis.

A good illustration of this new introduction is given in *Garden and Forest*, September 26. Though a rapid grower, it was considered to be a shy bloomer, but it appears that it only requires time, and that after it has grown to a good size it flowers freely. It is spoken of as a "very beautiful, very desirable and perfectly hardy small tree, requiring moist soil and plenty of room in which to display the graceful sweep of its branches."

The Week's Work.

THE ORCHID HOUSES.

By W. H. White, *Orchid Grower, Burford, Dorking.*

Owing to the almost sunless character of the past week the management of the houses will require modification made in the general practice. Although the season has been favourable to Odontoglossums, Masdevallias, and other cool Orchids, the tendency to undue elongation of growth is apparent in some collections, and the lack of heat and light has not tended to the consolidation of growth in Cattleyas, Lælias, Dendrobiums, many of the Mexican and Brazilian species, &c. Thunias also may be included; in fact, some of our plants of this species are as green as they were when growth for the season was finished. Every cultivator of experience knows too well the evil effects produced on immature growths during the winter months. The best measures to take at this season in regard to this matter are to afford a drier atmosphere and a free circulation of air during the warmer parts of the day, which if steadily adhered to, will assist the ripening up of the pseudobulbs, and check the development of spot and other diseases. The external air being cool and moist, there is no need to damp the paths, &c., so often or so heavily as in summer, and unless fire-heat has to be made use of, a moderate amount of damping morning and afternoon will suffice in either division. It is also important that the greatest amount of light be obtained, and this can only be by washing the glass, especially if situated near a large town. Very few plants now require to be potted, and many species are at rest, which afford the grower a good opportunity to overhaul the entire collection, and clean and re-arrange. In the cool houses slugs must be hunted for, as these creatures are now most troublesome, having been introduced to the houses in the sphagnum moss used in the repotting. They are concealed by day low down in the moss or in the axils of the leaves, but at night they come out and should then be diligently sought for and killed. Numbers of slugs may be caught by placing small shallow pans half filled with bran about the stages; young Lettuce and Cabbage leaves, &c., are also useful for entrapping them. Some few of the Odontoglossums that are pushing their spikes, should be protected by wrapping a piece of wadding round the base of the spikes. The lovely rose-scented Odontoglossum (Miltonia) Roezlii, now in full growth, should be frequently afforded water in large quantities at the root, especially if growing in small pots. I have failed several times with this species, owing, I believe, to having grown it in too warm a house; our plants are at present at the warm end of the Cattleya-house, where they certainly succeed better than when they were in the East Indian division. Other beautiful Orchids which do well under identically the same cultural conditions as M. Roezlii, are Miltonia, Warscewiczii, M. Schroderiana, and Phaius Humbloti. The following species which have passed the summer in the cool house should, if not already done, be removed to warmer quarters in the intermediate division, where they will get plenty of light and air: Miltonia vexillaria, Oncidium bifrons, Odontoglossum Krameri, O. Insleayi, Masdevallia tovarensis, M. Schlimi, M. ephippium; also those of the Chimæra section, not forgetting two such pretty little species as M. ionocharis and M. Wendlandiana.

FRUITS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

PINES: SUCCESSION PLANTS.—Those intended to fruit early next season should now be in a well-matured state, and kept at rest until the time arrives to start them. A lower temperature may now be afforded them, viz., 70° to 75° by day, with a free admission of air when the weather is mild, and a night temperature of 60° to 65°, with bottom-heat not greater than 80°, very little water being afforded at the roots if the material of the bed in which they are plunged is in a moist condition. It is advisable to water this rather than to supply much water at the roots, which would tend to excite them into growing before the proper time. Any suckers which may show on the plants should be removed as soon as they can be seized by the hand. The house should be kept moderately moist by damping the floors, but syringing the plants should cease, and steaming the pipes be avoided, as the moisture thus evolved condenses on the glass and drops as water on to the plants.

THE FRUITING-HOUSE.—Keep a moist atmosphere, with a night temperature of 70°, and a day temperature of 75° to 85°; the higher figure at closing time, with sun-heat; the bottom-heat may stand at about 85°, and in bright weather damp the plants overhead with a fine-rose pot. Afford air in small quantity in the morning, closing early after noon. A good amount of water will be required by these plants up to the time when the fruit begins to change colour.

SUCKERS.—Those growing strongly may be repotted if the pots are full of roots, and likely to suffer by being too much pot-bound. Ventilate freely to prevent drawing up of the leaves. A night temperature of 60° will be sufficient for the present; day temperature 65° to 70° according to the state of the weather; but it may run higher with sun-heat and a good circulation of air; overhead damping being avoided for some time to come. The re-arranging of plants in pits and houses to suit the requirements of the plants at different stages may now be done, at the same time giving attention to the bottom-heat, bearing in mind that strong bottom-heat will not be required before the New Year. When the bottom-heat is obtained from tan, or Oak and Beech leaves, which kinds are the most lasting and trustworthy, they should be put into heaps to ferment, being fre-

quently turned in readiness for use. Care must be taken when using fresh tanner's bark, as it quickly heats if used by itself; it should be mixed with old leaves or one-third half-spent tan, so as to give a gentle heat for the season. For the linings of pits, leaves and stable-litter afford lasting and uniform heat if well mixed together.

VINES.—The present is a good time for renovating exhausted borders of the early vineries. If the Vines are free from mealy-bug, and it is desirable to put new life and vigour into them, carefully lift the roots, re-draining and re-making the border, as recommended in my last Calendar. There is not the least danger to the Vines if this be done with ordinary care. Some years ago I lifted a very old Black Hamburgh Vine, that was considered at that time to be in the last stage of existence. This filled one lean-to vinery, and the roots were outside. These were carefully taken up, the work being begun by taking out a deep trench at the front of the border, and forking out the old soil from amongst the roots, wrapping them in damp hay and mats as they were taken out, and pruning those that were broken, or where they lay thick together, and gradually working right up to the wall of the vinery. When the new border was made, the roots were spread all over it, about 12 inches below what would be the level of the border. This work was performed in January, and when it was finished, a gentle hotbed was placed on the border, and the house started forthwith. A nice crop of well-coloured fruit was obtained the same year; and the improvement for several years after—as long indeed as I had the management of it—was remarkable. Vines for fruiting next spring may now be pruned, and the Vines and house put in order. Do not strip off the old bark; many of our Vines have not been peeled close for fifteen years, and if there is mealy-bug on Vines, it must be got rid of by washing with soft-soap and water, and giving them the tar-mixture, painting the walls and wood-work of house with neat parafine, and removing 3 inches of the top-soil of border. The best remedy is to clean the Vines and border out, and plant afresh. Pot-Vines for very early work should now be started, keeping the house close, without firing, for a fortnight. Do not prune them now.

THE KITCHEN GARDEN.

By Arthur Coombes, *Gardener, Himley Hall, Dudley.*

THE EARLY WINTER LETTUCES.—The mild weather has hastened the development of Lettuce of all ages; those it is resolved to store should be lifted and planted in light soil in cold frames, and near to the glass, but not touching it. All should be lifted except those ready for present use, which may be protected where they grow. In the frames plant thickly, just leaving each plant clear of its neighbour; and afford one good watering after planting, the lights being left off the frames during the day, unless rain falls, when they should be put over the plants, and tilted fully at the back. Do not close the lights at night, unless frost threatens, in which event mats may be laid on them, and during hard frosts thatched hurdles or litter. If it appears advisable to sow Lettuce seed, let the sowing be made in a cold frame.

CELERY.—The earthing-up of the midseason crop should be pressed forward during dry weather, and the final banking-up should be done before severe frosts occur. The leaves left above the top of the ridge may be saved from injury by frost by tying little bundles of straw together at one end, these being opened out and placed athwart the ridges. Other simple contrivances of a like kind will occur to most men. No earthing up of later crops should be done for the present, as it is quite safe so far; a little soil should, however, be added every ten or twelve days, or as fast as the leaves grow out of the soil last given. Afford this crop manure-water at times, and thorough waterings whenever the soil has become dry.

ENDIVE.—The final plantings may now be made on warm dry borders, or at the foot of south walls. In any case, protection of some efficient kind will be needed in frosty weather. Endive may be placed in cold frames, where the plants will continue to make growth, and prove useful in the winter for salads and stewing. Full-grown Endive may be blanched where it is growing, or it may be placed in the Mushroom-house, or other dark room. I prefer to cover the plants on the borders with inverted flower-pots, stopping up the holes so as to exclude light, and when frost occurs covering them with litter, &c.; they are thus safe from injury by frost, and may be used as needed; but if covered up for more than a week, rotting commences. Under slates or roofing-tiles laid flat on the plants, this decay does not occur.

THE FLOWER GARDEN.

By John Lambert, *Gardener, Powis Castle, Welshpool.*

HARDY ANNUALS.—In order to have these useful flowering-plants fit for transplanting into the beds in the early part of the new year, early attention is requisite. Where it is found impracticable to enliven the beds during the winter with Aubrietias, Arabis, Daisies, Polyanthus, &c., or on the other hand, by the use of the many kinds of hardy shrubs well adapted for this purpose, a list of which may be found in one of my earlier Calendars, recourse may be had to the sometimes neglected hardy annuals, which, when they are judiciously chosen, enable the gardener to escape some of the anxieties and disappointments which often attend the deferred planting of the summer bedders, by reason of an unwillingness to disturb the hardy flowering occupants of the beds. The annuals chosen should be of proved hardy nature; early in coming into flowering, and of suitable height, &c., for the beds. The first thing to be done is to select the site for the seed beds, which should lay warm, dry, and exposed to the sun as much as possible, and not be overhung by trees. Having dug some garden refuse, leaves, &c., into the soil, tread it evenly and regularly all over, and then build a low wall of sods or boards round each bed which may not be less than 4 feet wide, and of any desirable length, bend over some Ash or Hazel rods, connect these with others laid longitudinally, and you have a framework easily covered with mats or tiffany in the event of hard weather. In these shallow pits place some light and friable soil to a depth of 5 or 6 inches, and make it firm. The seeds may be sown in lines thinly and in quantity to meet probable demands. The drills in which the seeds are sown must vary in depth according to the size of the seeds; those for the finest being made shallow and flat, the seeds being barely covered, and none may be more than half an inch deep. It is a good plan to put various seeds of about one size by themselves, and cover them by sifting fine sandy soil over them. The seeds being sown, water the beds gently with a fine rose watering-can, and when germination takes place stir the soil amongst the seedlings, and give air freely in all but frosty weather.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

THE PLANTING SEASON: PREPARATIONS FOR PLANTING.—Judging from the manner in which the majority of fruit trees are changing the colour of their leaves, the planting season is likely to commence earlier than usual, and all rearrangements should be decided upon and carried out at once. Although gardeners can generally depend upon ordinary bush, pyramid, or orchard trees supplied by nurserymen of repute in fulfilment of an order, being true to name and well found in roots and branches, it is more satisfactory to visit the nursery and select trees suitable in height of stems, &c., for the various positions they may be required to fill, and also to note that the stocks on which the trees are worked are swelling kindly with the scions. In the case of cordon Pears it should be particularly ascertained if the varieties desired succeed on the Quince stock, for many of our best Pears do not. Such varieties should either be on the Pear stock or have been double grafted.

GATHERING THE CROPS.—The gathering of all but the latest ripening kinds will have been general during the past week or two; and although this is earlier than usual for some of the varieties of Pears and Apples, the foliage having assumed a yellow colour and the fruit parting easily from the wood, it would not benefit it much to leave it longer on the trees. In the case of Blenheim Orange Pippin, Cockle Pippin, Rosemary Russet, Braddick's Nonpareil, Claygate Pearmain, and some other late Apples, these may be left till the end of the month, unless sharp frosts occur, when gathering should not be delayed. Such late Pears on walls as Winter Nelis, Easter Beurré, Beurré Rance, Jean de Witte, Olivier de Serres, Bergamotte d'Esperen, Josephine de Malines, Knight's Monarch, &c., should not be gathered for at least a fortnight, or before the beginning of next month if the weather keeps mild. Two or three thicknesses of fish-netting hung over the trees at night would protect the fruit from slight frost, as well as from tom-tits. Do not let fallen fruits remain on the ground, as we assume that the bulk of these are infested with grubs, which, escaping from the fruit, hibernate in the ground. All fallen fruit, if fit for consumption, should be taken care of, and what is unfit given to the pigs, or put where the grubs cannot escape into the soil.

PLUMS AND DAMSONS.—The in-gathering of Coe's Golden Drop, Belle de Septembre, and some other varieties should now be finished. These fruits may be kept fit for use for two or three weeks if laid out in a single layer on shelves or tables in a dry and somewhat warm room. Damsons treated similarly can also be kept for the same length of time.

MEDLARS AND QUINCES ripen better if left ungathered till the frosts come, or till, in the case of Quinces, they begin to fall; a few degrees of frost will not injure either fruit. Medlars are likely to shrivel if gathered early, and rendered thereby useless for jelly-making and the dessert; and they should not be gathered so long as the foliage is fresh and green.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton, S.W.*

MIGNONETTE.—The supply from outside having now failed, any further cutting must be from pot-grown stuff. If plants have been prepared for this purpose, they should now be given liberal treatment; and liquid manure from the farm may be afforded twice weekly. Slender supports, such as may be got from worn-out birch-brooms will be necessary, and should be afforded them at once. Arrange succession and spring batches in a position near the glass in airy light houses, and carefully water them. Thin out seedlings in 3-inch pots to five, if spikes of a medium size are desired, but, where very fine spikes are in demand, three plants will be sufficient, these being flowered in 5-inch pots.

SEASONABLE HINTS.—In the majority of private gardens the principal stock of winter flowering plants having been put under glass protection, the dangers of sudden frosts are guarded against. The success or otherwise of the various subjects will unmistakeably show whether the necessary care and attention have been bestowed on them. Success is coveted by all, but it can only be achieved by the greatest care now and at all subsequent stages in their development, and, as was pointed out in my last calendar, the grouping of the various subjects plays a very important part in producing the best results. This is a most difficult matter where a large number of plants of different requirements have to be packed into a house not suited for them. I do, however, urge that, where space will admit, the subjects should be classed and placed according to their wants generally. The right way of doing this is only to be acquired by practice; plants which have been growing in the open should, when placed under glass, be treated as naturally as the changed conditions will permit. Abundance of air should be afforded on all suitable occasions, both day and night, and a slight heat in the water-pipes is necessary at this season to dispel excess of moisture, or the fleshy growths formed under more natural conditions soon become a prey to damp, mildew, &c. Water is another important factor in maintaining a healthy condition, and it must be applied at the roots, only at such times as the plants require it.

GARDENIAS.—Spring-struck plants now growing in 5-inch pots should be well-rooted, and they will now require a tea-spoonful of "Standen's Manure" to each pot weekly, which should be well watered in with soft-water. The last pinching having now been given, a strong, stocky growth should be aimed at; any weak shoots should be cut out. To keep the foliage clean, dip the plants once a fortnight into Murray's Electric Mildew and Insect Destroyer diluted, and prepared as directed.

GLORIOSA SUPERBA.—Less water at the root is now required, but the supply should be very gradually diminished, so that the ripening of the tubers may not be unduly hastened.

ARISTOLOCHIA ELEGANS.—Plants which have had a long flowering season, will now be showing signs of exhaustion, and will require less water at the root, only sufficient being supplied as will keep the wood from shrivelling.

CLERODENDRON BALFOURIANUM.—Plants, if grown in pots, should be placed in a position commanding the greatest amount of sunshine, so that the wood may become thoroughly ripened, failing which an indifferent show of flower will result next season.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication. — *All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	Oct. 15	Dutch Bulbs, at Protheroe & Morris' Rooms. Plants from Belgium, &c., at Protheroe & Morris' Rooms. Stove and Greenhouse Plants, at Carlton House, Red Bridge Lane, Barking Side, by Protheroe & Morris.
TUESDAY,	Oct. 16	Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids, at Protheroe & Morris' Rooms. Clearance Sale of Nursery Stock, at the Nursery, Feltham, by order of Messrs. C. Lee & Son, by Protheroe & Morris. Highly important Sale of the remaining Portion of the famous Pickering Lodge Collection of Established Orchids; also Carriages and Wines, by Protheroe & Morris (three days).
WEDNESDAY,	Oct. 17	Dutch Bulbs at Protheroe & Morris' Rooms. Unreserved clearance sale of Nursery Stock at the Hosey and Darenth Nurseries, Westerham, by order of Mr. A. Jeffkins, by Protheroe & Morris (two days).
THURSDAY,	Oct. 18	Dutch Bulbs, at Protheroe & Morris' Rooms. Nursery Stock, at the Sale Nurseries, Loughton, by order of Messrs. Paul & Son, by Protheroe & Morris (two days).
FRIDAY,	Oct. 19	Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	Oct. 20	Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—50°.4.

A Vegetable Exhibition.

VEGETABLE culture is a matter of such importance to the community, that we are glad to welcome the suggestion that a large exhibition be held at the Crystal Palace next year. Vegetables of all sorts can be, and are grown in this country to a degree of perfection rivalling, if not surpassing, anything that is done elsewhere, and foreign competition in this case is not a thing to be seriously apprehensive of. Vegetable culture, moreover, is pre-eminently an art for the cottager and the allotment-holder. They can scarcely grow too many, and their quality when grown, providing they have good varieties to begin with, depends essentially on the very qualities which a labourer should possess. County Council lecturers and demonstrators have here a fine field as instructors before them, and their work in this department is sure to be generally appreciated. We attach more importance from this point of view to vegetable culture than to fruit culture. The questions relating to marketing and distribution are, of course, much the same as in the case of fruit. Wherever water-carriage can be adopted, it would be desirable to make use of it, as railway rates are in this matter, and, we fear, are likely to be, prohibitive for all but the earliest and finest samples grown by a different class of growers.

If a large show of this kind be held, we hope the promoters will also take into consideration the unnecessarily narrow selection of vegetables we have now to put up with. Each season brings with it its new varieties of Potatos, Peas, and the like, the differences between which it demands a skilled expert to see; but an absolutely new vegetable is a rarity indeed, and worse still, when it does make its appearance, it is generally received with indifference, if not something worse. A great society, which does not look exclusively to commercial interests, can do something towards giving us novelties such as we are speaking of, by encouraging them by handsome prizes and other means. We can hardly expect a private organisation of growers to take this view of the subject. For progress in this particular direction we must look to some body which has broader knowledge, wider sympathies, and more far-reaching opportunities.

The cooking of vegetables in this country is also a matter urgently demanding improvement. In no country, we are disposed to say, are there, as a rule, better vegetables than in our own, and in no country are they worse cooked.

Appended is the circular we have received, with the general purpose of which we sympathise entirely:—

We beg to inform you that at a well attended meeting of persons interested in vegetable culture, held in the Board Room of the Crystal Palace, on Saturday, September 29, 1894, it was unanimously resolved, that "It is desirable to hold next year at the Crystal Palace a great National Exhibition of Potatos and other Vegetables."

A thoroughly representative list of members of the horticultural seed trade, gardeners, amateurs, allotment holders, market traders, the Press, &c., was read, and it was further unanimously resolved: "That subject to their approval, these persons do form the General Committee of the Exhibition, with power to add others."

Having been appointed by the meeting treasurer and secretary respectively *pro tem.*, we beg most respectfully and urgently to invite you not only kindly to allow your name to be added to the general committee, but also promise support for so important an Exhibition.

Should you consent, you will be invited to attend a meeting of such general committee, which will be held in London at an early date.

Rest assured that every effort will be made to make the proposed Exhibition not only a great success, but also a vital force in connection with vegetable culture in the United Kingdom." *H. Balderson, F.R.H.S., Treasurer; Alexander Dean F.R.H.S., Secretary*, 62, *Richmond Road, Kingston-on-Thames.*

Oliver Wendell Holmes.

WHEN all the literary world and all readers of taste are mourning the recent death of the greatest of American *littérateurs*, Dr. OLIVER WENDELL HOLMES, it may be interesting to the readers of the *Gardeners' Chronicle* to recall his "most intense, passionate fondness"—we use his own words—for trees. In what is, perhaps, his greatest prose work, *The Autocrat of the Breakfast Table*, he speaks of putting his wedding-ring on his tree-wives, and says he has almost worn out this 30-foot tape on the rough bark of the old New England Elms and other big trees. "Now, if you expect me to hold forth in a 'scientific' way about my tree-loves," he continues, "to talk, for instance, of the Ulmus americana, and describe the ciliated edges of its samara, and all that—you are an anserine individual, and I must refer you to a dull friend, who will discourse to you of such matters. . . . No, my friends, I shall speak of trees as we see them, love them, adore them, in the fields, where they are alive, holding their green sun-shades over our heads, talking to us with their hundred thousand whispering tongues, looking down on us with that sweet meekness which belongs to huge, but limited organisms." The passage is perhaps too long for further quotation here. It goes on to speak of "old Daddy Gilpin," the mother-idea in each particular kind of tree and many of the first-class Elms, trees over 20 feet in clear girth 5 feet above the ground, in New England. Every tree-lover should read it, and, as there are not indexes to every edition of the *Autocrat*, it may be added that it is in the tenth paper of the series. In acknowledging the receipt of the first part of my *Familiar Trees*, sent him nine years ago, by Professor BOULGER, Dr. HOLMES wrote: "I have long had Evelyn and Strutt upon my shelves, and am still a faithful tree-worshipper. . . . It would be a good idea to give pictures of famous trees, such as the Cowthorpe Oak, which you mention, the Yardley Oak, the finest Elms and Lindens, the Burnham Beeches (if they are not too commonly figured), the grandest old Yews, &c." This shows that his enthusiasm for trees was not limited to those of the country of his birth; for, like all the New England writers of his time, IRVING, LONGFELLOW, EMERSON, not forgetting ASA GRAY, and the others, he always looked upon Old England as the mother country.

THE GREAT FRUIT SHOW.—Leaving to others to note the results of the success of this great venture, I would like, writes Mr. D. T. Fish, to note a few of its surprises. To those who had the privilege this summer at the National Rose Society at Windsor, of observing in the Royal Gardens at Frogmore that all things horticultural were possible to Mr. Owen Thomas, the Royal Trophy of Fruit at the Palace Show could hardly be a surprise (see fig. 58, p. 445). The Royal exhibit was alike regal in its quality and quantity, and specially at the present time, when certain classes seem disposed to throw cold water on fruit-growing. It was pleasing also to note that amid all the Grapes grown at Frogmore, the venerable giant at Cumberland Lodge, in its 110th year, and furnished with 2200 bunches, was not forgotten. Next to this, the quality all round of the display of Apples and Pears from the Royal gardens at the close of such a sunless summer excited surprise. A list of the varieties of fruit shown was printed on a card. Next to the Royal Trophy of fruit I would place the Scotch Grapes, sent from Allos, grown with a new manure, as the greatest surprise. Grapes altogether were of good quality, and Mr. McIndoe and others have by no means lost their cunning. But Mr. Kirk, either through his skill, his stimulants, or the youthfulness and vigour of his Vines, has stolen a march in regard to size and colour on the veterans. The "Duke" was never shown in such condition before as at the Palace. The bloom was also perfect. Of the flavour I can give no opinion. Enquiring of one of the judges on this point, I found that it was not the rule now to apply this old-fashioned test of quality. The next and most pleasing surprise was the abundance and high quality of the Apples and Pears. The sensible system adopted by the Royal Horticultural Society of offering prizes for special varieties enables most hardy sorts to compete only, or chiefly, with its peers, and leads to a grand display.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The eighth anniversary dinner of this Institution (founded twenty-eight years ago) was held at the Cannon Street Hotel, City, E.C., on October 9. ARNOLD MOSS, Esq. (Messrs. Wrench & Sons, Seedsmen) presided, he being supported by Sir Stuart Knill (ex-Lord Mayor), Clarence Smith, Esq, M.P., H. J. Veitch, Esq., W. Y. Baker, Esq., W. Marshall, Esq, and other gentlemen. Covers were laid for 110 guests, and 109 sat down. Mr. Moss, in proposing the "Toast of the Evening," said that the society he represented deserved well of all the gardening community. The chairman

FIG. 57.—PHYSALIS FRANCHETI: JAPANESE BLADDER CHERRY—REAL SIZE. (SEE P. 434.)

furthermore urged all who were not members of this or kindred institutions to lose no time in joining it; the position of the gardener during the past few years of depression not being any too bright, it was incumbent on all to make that provision necessary to ensure assistance in times of sickness, calamity, and old age. The chairman stated that the total membership now was about 520, and the invested funds to date amounted to close on £10,000, no better guarantee than this being needed of its stability and sound management. Mr. Hudson (Treasurer) responded, saying the executive were determined that this Society should be second to none for the advantages it offered to the gardener. He quoted the remarks made by a new member who had joined the Society at the last committee meeting, which showed the deplorable condition of the branch to which he had hitherto belonged of one of the largest mixed benefit societies in the country. Mr. Clarence Smith bore testimony in his remarks, when proposing "The Visitors," to the sound condition of the Society's investments; and Sir Stuart Knill, in responding, alluded to the Gardeners' Company being granted the Livery during his term as Lord Mayor, and bore testimony to the admirable floral arrangements, and the handsome dessert furnished for the guests, both being characteristic of the Institution. W. Marshall, Esq, replied on behalf of the Honorary and Life Members, stating how gratified he, as one of the originators, was at the progress that had been made, urging also that the carefully drawn up rules at its formation thirty years back be studiously guarded. The tone throughout the meeting was excellent, a keen interest being evinced in the proceedings, which bodes well for the immediate future of this worthy Society. The financial results were also of a gratifying character. The chairman announced his intention of becoming a life member, at the same time stating that Sir Stuart Knill had much pleasure in doing the same, several new honorary members were also announced by the chairman; among others, N. N. Sherwood, Esq., sent a donation of £5 5*s.* to the voluntary convalescent fund, from which grants are made to members during convalescence, a noteworthy departure in benefit societies. This fund was augmented early in the past spring by a donation of £50 from the same gentleman, and previously by the then recorded munificent gift of £100 from Mr. and Mrs. H. J. Veitch on the occasion of their silver wedding. Further particulars can be had of the Secretary, Mr. W. Collins, 9, Martindale Road, Balham, S.W.

Professor Pringsheim.— On September 6, died, at Berlin, Professor Dr. Nathaniel Pringsheim, Geheimrath, in his seventy-first year. He was one of the most eminent botanists in Germany. He was born on November 30, 1823, at Wziesko, in Silesia; studied medicine, then botany, at Breslau, Leipzig, Berlin, and Paris; became Privatdocent of Botany in Berlin, 1851; Member of the Royal Academy of Sciences, 1856; Professor of Botany at Jena, as successor to Schleiden, 1864, and lived since 1868 as private botanist at Berlin. He was the first who gave, in 1855, the exact proof that the spermatozoids of the Algæ unite with the female cell. A great many of his studies concern the Crytogamous plants, and those of the most general interest are those concerning the Potato disease. Another field of his researches was the development of axes and leaves. The third and last series of his researches concerned chlorophyll. Contrary to the opinion of the greater number of physiologists, Pringsheim said that it is not the chlorophyll which assimilates the carbonic acid, but the protoplasm itself. The chlorophyll, he says, has only the function of protecting the plasma against the too energetic rays of the light in a like manner as the anthoxyan protects the young leaves in early spring. And, indeed, this interpretation, theoretically as well as practically, is well founded. The plasma must have assimilated before the chlorophyll existed. It would be very astonishing if the plasma were deprived of one, if not the most important, function which it has. And, indeed, there are known a great many cases in which plasma assimilates without chlorophyll. Each hair of a plant, containing plasma but no chlorophyll, assimilates the carbonic acid as well as a cell with chlorophyll. It is true, to make this out, most exact experiments are requisite, and it is significant, that all the researches of Prof. Pringsheim were made with the most scrupulous exactness. Besides this, Pringsheim never was content with one or two experiments, if even they gave the same result. For months he would make daily the same experiment until he had absolute certainty that the results were exact. Pringsheim founded the first physiological botanical institute at Jena. After this plan all the other physiological institutes were established. Though not teaching in the Berlin University, yet a great many botanists were assistants in his private laboratory, i.e., Strasburger, Pfeffer, Vochting, Reinke, &c. Since 1857 he edited the *Jahrbücher für wissen schaftliche Botanik*.

National Chrysanthemum Society.— A fully attended meeting of the general committee took place at Anderton's Hotel on the 8th inst, Mr. B. Wynne in the chair. The Hon. Secretary reported that the prize-money awarded at the September show had been paid, and the medals were forwarded to their several owners. An interim financial statement was made, showing the finances of the Society were in a very satisfactory condition. Some amendments to the rules recommended for adoption at the next annual general meeting were approved by the committee, one of the most important being that elections to the general and Floral Committee shall be by means of balloting papers. Twenty-three candidates for membership were elected, and the Launceston Horticultural Society, Tasmania, and three others admitted to affiliation. It was resolved that as the Society would attain to the fiftieth year of its existence in 1896, that measures be taken to celebrate its Jubilee in a suitable manner, and a sub-committee, consisting of the officers of the Society, and Messrs. H. B. Ironside, J. Wright, G. Gordon, H. J. Jones, T. W. Sanders, and T. Bevan be appointed a sub-committee to prepare a scheme, and submit the same to the general committee.

Agricultural Education in Aberdeenshire.—A meeting of the Institute of Agricultural Education was held in Aberdeen University Buildings recently. The Institute consists largely of public school teachers in Aberdeenshire who have gone through the University courses on agriculture, which were supported chiefly by the Aberdeen County Council. The first business was the consideration of the new syllabus of the Science and Art Department. An examination of this syllabus showed that it is essentially on the lines of the syllabus suggested by the Institute by the Department, and it was agreed to intimate to the Department full satisfaction with the change. It was felt that most important work had been done by the Institute in thus improving materially the character of the agricultural education that will now be given throughout the whole country, and bringing it into harmony with what has all along been taught at Aberdeen University. The Institute then considered the desirability of bringing the agricultural syllabus of the Scotch Education Department into co-ordination with the new national syllabus, and steps were taken with this intent. The Circular of the Aberdeen County Council recently issued to public school teachers was then brought under review, and a unanimous feeling was strongly expressed resenting paragraphs numbered 2 and 3 of this circular, which seems to give a preference to teachers who happen to be qualified by the Science and Art Department over those who are qualified by going through the special courses at Aberdeen University, sacrificing the holidays of two successive years for this purpose. When it is remembered that a graduate whose course has included any subject in which he may have passed with little merit, is regarded as qualified by the Science and Art Department, and when, besides, the same qualification may be got by any youth passing an examination preceded by twenty to forty hours' attendance at lectures, it does seem extraordinary not to place on a higher stage, or at least on a footing of equality, those tried men who have spent over 200 hours, and passed four of six examinations which were approved and controlled by the Technical Instruction Committee. It was doubted whether the Committee really meant what the Circular seemed to imply, and the subject was remitted to the Committee of the Institute as a matter demanding urgent attention.

Scottish Horticultural Association.— The specimens exhibited by Mr. M. Chapman, Easter Duddington Lodge, at the monthly meeting of the above Society, held on Tuesday evening the 2nd inst. at 5, St. Andrew Square, Edinburgh, consisted of Polygonum vaccinifolium, one of the best late-flowering rock plants; P. amplexicaule, Lobelia syphilitica, L. tupa, Phygelius capensis, Tricyrtis hirta, Rosa bengalensis viridiflora, Ceanothus Gloire de Versailles, Physalis Alkekengi, ripe fruit; Pernettya alba, ripe fruit.

South Birmingham Gardeners' Mutual Improvement Society.—The first meeting of the autumn session of the South Birmingham Gardeners' Mutual Improvement Society was held on Thursday, October 4, when Mr. J. Udale, the horticultural lecturer for the county of Worcestershire, gave an interesting and practical lecture on small fruits. In the course of his remarks, Mr. Udale warned his hearers against accepting the statements made by some writers in the horticultural press which are only likely to mislead. His advice was, do not be misled, and maintained that the enormous fruit crops and great profits sometimes seen on paper should be taken with some amount of reserve, for mostly they are isolated cases, and if not isolated, occur only in districts where the climatic and other conditions are favourable for certain kinds of fruits.

The "Botanical Magazine."—The October number contains coloured figures and descriptions of:—

Uraria crinita, Desvaux, t. 7377.—An erect hairy under-shrub, with equally pinnate leaves and long erect many-flowered spikes. Flowers small, papilionaceous, rosy-purple. East Indies, Malaya. Flowered at Kew.

Senecio laxifolius, Buchanan, t. 7378.—This is the New Zealand shrub to which the name latifolius was inadvertently given in a recent number of the *Gardeners' Chronicle*. The description there given from the *Handbook of the New Zealand Flora*, applies to quite a different plant. It was grown by Mr. Gumbleton, near Cork.

Iris atropurpurea var. atrofusca, Baker, t. 7379.—This is the plant described in our columns last year as I. atrofusca, but which is now considered by Mr. Baker to be a variety of atropurpurea. It is a native of Palestine.

Trichocentrum tigrinum, Lind. et Reichenb., t. 7380.—Described in our columns by Linden and Reichenbach, 1869, p. 892. It is a native of Central America, and has decurved peduncles; flowers 3 inches across in the longest diameter. Perianth segments lanceolate sub-equal, yellow, finely spotted with purple; lip larger than the segments, cuneate with two rounded lobes on the anterior portions pure white, slightly suffused with pink at the base.

Impatiens auricoma, Poisson, t. 7381.—A handsome perennial Balsam, with lanceolate leaves tapering at the base into a short grooved stalk provided with glands at its edge. Flowers yellow streaked with red. Native of the Comoro Isles.

Diseases of Fruit Trees.—Mr. D. T. Fish has delivered the first of two lectures on this subject at Bournemouth. The following is the syllabus of these lectures:—Lecture 1, "Causes and characteristics of Disease:" Climatal—Constitutional—Cultural—Insect Agency—Insanitary State of Fruit

Trees and Bushes; Fungi—Canker—Mildew—Gum—American Blight, or Woolly Aphis—Ligatures and Bruises; General Preventative Measures. Lecture 2, "Special Preventatives and Specific Cures:" Thorough Drainage—Improved Soils—Warmer Root Runs and Improved Roots—Avoidance of Extremes in Manuring—Pruning—Cropping—Better Matching of Stock and Scion—Greater Cleanliness of Leaf, Branchlet, Bole; Special Sprayings—Smearings—Dustings—Dressings—against Aphides, Spiders, Mites, Maggots, Caterpillars, Scale and Scab.

MARKET PRODUCE IN MATABELELAND.—A temporary sojourner in Buluwayo, writing home a letter of warning, includes the following items in his communication:—"Vegetables fetch a big price because there are so few. Recently 1 lb. of fresh butter was sold by auction for 13*s*. Onions are fetching 2*s*. 9*d*. each, and 2*s*. 3*d*. is the price for two small Cabbages." It does not, however, follow from this that market gardeners are to take wing for South Africa. It is not stated how many intending consumers competed for the vegetables, and if they were "settlers."

CHRYSANTHEMUMS IN VICTORIA PARK, LONDON.—Mr. Moorman, superintendent, writes to the effect that the display of Chrysanthemums in bloom in this Park was opened to the public on Wednesday last, 10th inst. The collection, numbering from 2000 to 3000 plants, includes the finest exhibition varieties, and a large number of novelties of 1894. Probably the plants will, as a whole, be at their best three weeks hence.

ISLE OF WIGHT.—The monthly meeting of the Horticultural Improvement Association was held at Ryde on Saturday, the 6th inst., when a large number assembled to listen to an address on "Orchids for Amateurs," by Mr. T. W. Barker, gardener to J. Woods, Esq., Matlock Villa, Ryde. The chair was occupied by Dr. Groves, B.A., Newport. Mr. Barker staged a collection of plants, including Orchids, Ferns, and Caladiums. As this Association becomes better known, members are constantly being enrolled. The next meeting will be held at Newport, when the "Cultivation of Hardy Fruits" will form the subject of a paper. A vote of thanks was accorded Mr. Barker for his lecture.

SHIRLEY, SOUTHAMPTON.—An extra special meeting of the Shirley and Surrounding District Gardeners' and Amateur's Improvement Association was held at the Philharmonic Hall, Southampton, on the 1st inst., with a view of extending the operations of the Society, and holding fortnightly meetings during the winter months. The President, Mr. W. F. G. Spranger, presided over a large attendance of the members, and Mr. W. B. Hill, who kindly lent the hall for the occasion, also offered it for the winter months, if fortnightly meetings were decided upon. Mr. E. Molyneux, of Swanmore Park Gardens, gave an excellent address on "Fruit Trees for Walls and Espaliers," and detailed the proper method of pruning, training, root-pruning, &c., also diseases the trees are liable to, and the remedies for the same, besides a list of the best varieties to plant on different aspects. There were exhibited hardy fruits from Mrs. Day, Polygon (gr., Mr. J. Jones), twenty-four dishes; Mr. W. Perkins, J.P., Partswood (gr., Mr. J. Miles), forty-three dishes; and Col. W. S. Sinkins (gr., Mr. J. E. Wilcox), thirteen dishes of Pears, &c. There was a good collection of hardy perennials from Mr. B. Ladhams. The meeting terminated with votes of thanks to the lecturer, and the election of several new members.

HANLEY PARK.—Mr. T. H. Mawson has published an interesting account of the park at this town in the Potteries, where the conditions are anything but favourable to vegetation. He lays down the principles by which he is actuated, and considers that the plan of a public park should be based on the principles of design, and not merely on the imitation of Nature. No doubt for small places with architectural features all round, this is the right course to follow. Equally right is, that lodges, fountains, gates, and other structures should be designed in harmony with the general plan of the park. The pamphlet is interesting to read, and the illustrations are numerous and pleasing. It may be had from Mr. Mawson, Wenderholme, Windermere.

STOCK-TAKING: SEPTEMBER.—The Revenue Returns for the first half of the financial year, having shown a great increase as compared with those for the same period in 1893-94, the new American Tariff having got fairly into work, and the number of estates in "liquidation" having fallen off in September, we might have been led to the conclusion that trade and commerce were improving, notwithstanding the War in the East, the Scotch coal strike, unsettling news from France, and the condition of the Czar's health. The Board of Trade Returns for the past month show that trade is improving, because it is better than it was in the preceding month of August, though the comparison does not hold with respect to the corresponding period of 1893, but then there was one working-day less than in September last year, there being five Sundays, and this signifies a great deal indeed in making up a balance-sheet. The falling off in the imports is almost all owing to the items introduced in the general heading food-supplies—sugar, flour Wheat, &c. Those who have noted the corn averages in our columns during the past month, will have been prepared for a great fall in values under this heading; but without further particularising, we give here our usual excerpts from the "Summary" tables of the Returns noted, as follows:—

Imports.	1893.	1894.	Difference.
	£.	£.	£.
Total value of imports	31,378,830	30,249,136	—1,129,694
(A.) Articles of food and drink—duty free	12,008,558	10,684,372	—1,324,186
(B.) Articles of food and drink, dutiable	2,225,199	2,281,674	+56,475
Raw materials for textile manufactures	2,417,330	2,247,272	—170,058
Raw materials for sundry industries and manufactures	4,034,494	4,271,530	+237,036
(A.) Miscellaneous articles	1,229,683	1,027,125	—202,558
(B.)—Parcel Post ...	46,764	61,667	+14,903

It may not be out of place to note that the value of timber imported during the month is in excess by £152,000 of the amount entered for the same period last year; and we are reminded that the consumption of timber in the great Ural district in Russia is gradually and surely affecting the output of iron—a great industry there. Forests in other districts of Russia sadly lack conserving and replanting—in fact, an "Arbor-day" is much wanted in that vast country, as is acknowledged in the United States. Coming now to the imports of fruits and vegetables, &c., we take the following from the general mass of figures:—

Imports.		1893.	1894.	Difference.
Fruit, raw:—				
Apples	bush.	307,642	567,117	+259,475
Cherries	,,	...	...	...
Plums	,,	116,483	148,607	+31,921
Pears	,,	207,303	394,400	+187,097
Grapes	,,	214,299	191,702	—22,597
Unenumerated ...	,,	106,449	134,128	+27,679
Onions	,,	555,248	693,206	+137,958
Potatos	cwt.	37,303	29,470	—7,833
Vegetables, raw, unenumerated	value	£ 89,609	£ 106,530	£ +16,921

These figures are certainly calculated to "give pause" to British growers. It is interesting to know that the Board of Trade is moving in the matter of marking foreign fruits placed for sale on the English market. The authorities have shown that they had the power to interfere; but one would like to know why it was not put into operation long ago, and saved the expense in time and money of a Parliamentary inquiry into the subject, the Lords' Committee not having yet finished its labours! We turn now to

THE EXPORTS

For September, which amount to £17,599,320, or a decrease amounting to £834,809, as compared with the corresponding period last year. The coal strike and the extra idle day are quite sufficient to account for this difference, for trade with America has improved under many items; but the trail of the serpent is over everything just now; actual warfare and rumours of war are exercising their baleful influence over all the arts of peace; gallant though the struggle is in our plucky land. Trade with Japan is much affected, and the greater part of its imports are in British hands; nor can much be expected of China when the screw is being put on wherever money is to be had for military and naval purposes. To conclude, it may not be quite out of place here to note that rates of carriage by rail having been re-arranged, and lowered considerably, Silesian coals are now brought to the Western European seaboard, and sold at prices which renders competition with Scotch and English coal a very simple matter. Probably our market may soon be considered as very nearly lost.

DEVON AND EXETER GARDENERS' ASSOCIATION.—The work of the session was commenced last Wednesday evening (Mr. A. Hope presiding) with an excellent paper on "Present Day Gardening," by Mr. W. Swan, gardener at Bystock. The essayist reviewed the present state of gardening, and what was required at the hands of the modern gardener, as compared with what gave satisfaction to the employer of sixty years ago. He showed that while then we could wait with patience until Nature filled our apron with the products of the floral or vegetable kingdom, we now wrested from her choice fruits and flowers months before their natural time, all this being a more severe tax upon the skill and resources of the gardener of to-day. Referring to the sudden springing up of gardeners' associations all over the country, with memberships more or less numerous, according to the numbers in the respective neighbourhoods who were employed in the craft, he thought that any good centre in Devon, such as Exeter, for instance, would be a good place to inaugurate and carry on the system of allotment gardening as practised by the County Council of Surrey. At the close of the paper a discussion ensued, the chairman claiming that much of the popularity of present-day gardening had been brought about by the services rendered by the gardening press, which had done great service to gardeners and gardening. A hearty vote of thanks was awarded to Mr. Swan for his excellent paper.

THE PRINCIPLES OF HORTICULTURE.—On Tuesday evening Professor G. S. Boulger, F.L.S., delivered the first lecture of a course on the principles of horticulture, at Bruce Castle, Tottenham. The subject was "The Relation of Theory to Practice," and "The Life of a Plant." The lecturer began by referring to the fact that Lindley's *Theory of Horticulture* was not successful until re-named *The Theory and Practice of Horticulture*, as illustrative of the popular misapprehension of the meaning and value of theory. Starting from the economical principle that we should utilise to the full the powers of Nature, or produce the right thing in the right way, he insisted that the art or practice of horticulture is so dependent upon the science or theory that it might be called applied vegetable physiology. He then pointed out that the best results as to quantity and quality of produce were most likely to be obtained where the immediate object was profit, as in our market gardens, where not only soil and treatment had to be considered, but also the exigencies of the market. The science of horticulture, being merely the rational theory deduced from successful practice, it was essentially such science that the recent movement in favour of technical education demanded. Supposed opposition between theory and practice means either only unsound theory or unsound

practice. The successful cultivator, though perhaps unconsciously so, is essentially a man of science, basing his practice on his rational theory; but if he is to have confidence in his own action, he should have some acquaintance with the structure of plants and the chemistry of plant life. Science, however, is not only the interpreter of practice, generalising, systematising, and explaining the results of the observations of the practical man; but is also a guide, confirming, simplifying, or rejecting old rule-of-thumb methods. Every department of botanical science has its bearing upon horticultural practice, and one of the difficulties of the cultivator which is perhaps liable to be overlooked is that our garden plants, especially our vegetables, are necessarily under unnatural conditions, being, in fact, hypertrophied, and cannot, therefore, be judged by the canons of the physiology of normal health. Every species cultivated in our gardens demands separate study as to its physiological requirements; but there are broad principles of vegetable hygiene common to all. The life of the plant is a cycle from seed to seed, from the seedling just bursting from the germinating seed with its primary root and leafy shoot to the flower, the fruit, and the ripe seed ready for germination. In this cycle there are two marked and contrasted phases both of the highest interest to the cultivator: the nutritive stage, when root and shoot are actively engaged in the taking-in and utilisation of food for the development and growth of the individual plant, and the reproductive stage, when gay and sweet-scented flowers, and in some cases their insect visitors co-operate in the production of fruit "whose seed is in itself." This plant life, throughout both these cycles, is dependent upon food, upon temperature, upon moisture, and upon oxygen, and, therefore, soil, heat, ventilation and moisture, each demand careful attention. The next lecture will be on the soil and its treatment.

New Publications.—*Fertilisers and Feeding Stuffs.* By Dr. Bernard Dyer. (Crosby, Lockwood & Co.)—*Agricultural Journal of the Leeward Islands.* Edited by C. A. Barber.—*The Forester.* By James Brown; sixth edition, by J. Nisbet D. Œc, 2 vols. (Blackwood & Sons).—*A Popular Summary of the Law Relating to Parish Councils.* (Stevens & Sons).—*Journal of the Scottish Meteorological Society,* 1892 (Blackwood & Sons).—*Dictionnaire Pratique d'Horticulture, liv.* 30 (Hellebore to Humulus), O. Doin, 8, Place de l'Odéon, Paris.—*Monographie des Amaryllidaceæ, Bromeliaceæ et Iridaceæ, par* H. Baillon (Paris, Hachette).—*Flora of Mount Desert Island, Maine.* By E. J. Rand, and J. H. Redfield, Cambridge, Mass. (John Wilson & Son).

Home Correspondence.

The failure of the mulberry to ripen its fruit this year.—I should like it to be on record in your paper which is filed in all botanical gardens in different parts of the world, that in England this year the season has been so wet that although the Mulberries grew to a very large size, they did not ripen, but a mould fungus connected the fruits together and these fell to the ground in lumps as large as a fist. I ought to add that the Mulberry tree I refer to stood on a lawn on high ground quite open on all sides. *Thos. Christy.*

The fruit packing competition at the Crystal Palace.—Your correspondent writing under the signature "A. D.," p. 403, seems to be very desponding in regard to the fruit-packing competition at the late fruit show of the Royal Horticultural Society. I for one must say that I was pleased with the manner in which the winning exhibits were packed, and cannot see where "A. D." finds reason for grumbling. Take, for instance, the basket of Gros Colmar Grapes that won for Mr. Gore 1st prize, what fault can "A. D." really find with that exhibit? Not only was the method adopted simple, but it was decidedly the best, for scarcely one berry was rubbed; and what more, then, was needed? The materials employed were cheap and lasting. Take again, for instance, the 1st prize box of Peaches sent by Mr. Woodward from Barham Court, what could have been more perfect than the method adopted? The box in this case was decidedly cheap, costing but 1½*d.*, it being part of a butter-box, this costing but 3*d.*, which when sawn in two, makes two boxes similar to that used with the addition of a light lid. Surely there is no reason for complaint as regards the cost in this case. For the benefit of readers of this journal, will "A D." inform us in what manner these examples of fruit packing were at fault, for although fault-finding may be easy, it will be difficult to suggest any reasonable improvement, and decidedly more perplexing to put into practice a safer kind of package. *E. M.*

Peach and pear packing at the Big Fruit Show.—The method of packing adopted by the competitors, and Mr. Woodward in particular, was so good, it seems invidious to propose any improvement. Still, to guard against damage, by the package being violently dropped on to its sides or ends, I would suggest some such subdivision of the interior into square receptacles as that adopted by provision dealers when packing small lots of eggs. The material for this purpose should be very light, yet sufficiently strong not to give way, tin or perforated zinc, fine wire netting, thin white deal, or cardboard, the last-named will probably have the preference, it being cheap, light, and easily manipulated. Of course, wood-wool should be used as well. I think "A. D.'s" strictures on the packing on this occasion were uncalled for. *One of the Crowd.*

Peaches on open walls.—The note on p. 254 on the above subject prompts me to allude to the common assumption that Peaches will only succeed out-of-doors on walls with a southern aspect, and it is owing to this that they are seldom seen with other aspects. I hold that it is an advantage to the gardener to have Peach trees, where they succeed, on various aspects, as the Peach season is much lengthened, even with the same variety. For instance, Alexander, on a west aspect, will be fully a fortnight longer in ripening its fruit than against a south one. This is only one instance of the difference in the time required, and the advisability of variety. In this respect, I always make quite certain of a full crop of fruit from a tree of Late Admirable growing against an eastern aspect, and similar crops from a west wall of such varieties as Dymond and Grosse Mignonne. Walburton's Admirable is just the variety for a south wall, as the ripening is hastened by fully three weeks compared with what it would be on other aspects. What is said by the writer of the note anent the insufficient moisture at the roots is much to the point, especially such trees as carry full crops. The method, too, adopted by some gardeners in deferring the pruning of the trees till March is contrary to common sense. [We are not so sure of that, excellent crops being obtained from trees so managed, other things being rightly done. Ed.] I would ask what is the use of leaving surplus branches and shoots intact until the time named, and then cut them out? Far better to prune the trees directly the fruit is gathered, and thus give the remaining shoots the best chance of becoming matured. The out-of-door Peach cultivator must always be on the alert to subdue insect attacks, never allowing the trees to suffer more than he can avoid; and with the various insecticides now at command, this should be an easy matter. Do not plant Peaches on aspects exposed to the east wind, the trees suffering every year in the spring from curl and blister, and these attacks end in chronic ill-health. *E. M.*

The fruit show.—There is no denying that this three days' show was a grand object-lesson, showing the progress of British fruit culture. Unfortunately, however, it is feared that the very class that most needed such solid facts to convince them took little note nor interest of or in the fruit show. The *Times,* for example, which devoted considerable space to discussion of the question, had not a word to say, nor an inch of space to devote to an account of this great exhibition of one of the most important of our home industries. And though a call was made for Mr. Blackmore or other opponents at the close of Mr. Wise's able lecture in the Garden Hall at the Crystal Palace, not a voice in opposition was raised, just when and where it could have been at once and most fully answered. For the meeting-room at the Palace was packed on each day to its utmost capacity, mostly with practical fruit-growers, men of shrewdness and common sense, and of special skill, who are making fair livings though not colossal fortunes, out of the rising industry of British fruit-growing. But neither the show itself nor the most useful lectures on fruit growing in small gardens on Saturday, nor in large ones on Monday, had a word of sympathy from the *Times. D. T. Fish.*

Planting out forced strawberries.—Any doubts that I might have entertained concerning the success of planting Strawberries which have been forced, were set at rest upon viewing recently a patch of them at Gunnersbury House Gardens, the variety Vicomtesse Héricart du Thury being one of the most trusty for the purpose. It was not represented merely by a few plants nursed with an amount of care entirely out of keeping with the probable returns, or for furnishing a dish of fruit at a fixed date, but on a level piece of ground that had been heavily manured and deeply dug last May; the forced plants were put out at 2 feet apart in the rows, and 18 inches from plant to plant in the row—700 plants in all. In conversation with Mr. Hudson, I gleaned that he had removed all the flower-trusses as they had appeared till July 15, after which date they were allowed to remain, and at the time of my visit the plants were carrying flowers and fruits in profusion. The flavour of the fruit surpassed that of the summer-grown samples of the same variety this year. I omitted to ascertain the date of the first gathering, but from the remark passed that fruits had been gathered for some time, I concluded that it was long before the date of my visit that the first of these were fit for table. To lift the fruits above the ground, and also expose them to the sunshine, they were supported on twigs stuck in the ground. The success attained by Mr. Hudson shows the desirability of this practice being generally adopted, as the fruits are sure to be appreciated more than those of the late autumn varieties, which are mostly inferior in point of flavour to the Vicomtesse. *J. F. McLeod, Dover House Gardens.*

Agaricus arvensis.—I now send you two photographs of the Agaricus arvensis. They were very conspicuous objects in my park. The group, or rather one side of the group, my son photographed, had no specimen as much as a foot in diameter. No one in this neighbourhood had ever seen the Horse-Mushroom before. Some people here say they are as good as A. campestris to eat, others that they are very like eating leather, but as I never eat leather, I do not know how much they resemble each other. They are always in circles, and from measuring a dozen of these rings, my experience has been that where there are the largest Mushrooms, the ring has been most in diameter; the rings are from 20 to 40 feet in diameter (average 30 feet). More than a month ago (August 18), before we had them, Bristol market was full of them. I saw none here till September 2. *E. J. Lowe, Chepstow.*

Early Pears.—Whilst I am writing, I may mention that early Pears went decayed at once, some in two days; many sorts are badly cracked. Early Apples will not keep, and Damsons (some trees) have every fruit split open and worthless. Soon after the Apples and Pears set their fruits they were attacked by about a score small grubs in each; they swelled nearly to the size of a nut, and then turned like a ripe Medlar, and the caterpillar (I never saw it before) had disappeared. There had been an extraordinary bloom, and more set than I had before seen, but some large trees had not a fruit that escaped destruction. Has this been reported to you from other localities? *E. J. Lowe, Chepstow.*

The flowering of Yuccas.—Having noticed in the *Gardeners' Chronicle* for September 22 an enquiry regarding the age at which Yuccas flower, it may interest your Peterhead correspondent to hear of a plant of Yucca aloifolia which last year threw up a spike about 6 feet high, which it had not done for forty years to the knowledge of my employer. When the flower dried up I cut it away, and a strong growth pushed up, which I in July cut off at 3 feet in height this year and placed in a pot, and, strange to say, it also threw up a spike of bloom which grew to a height of 2 feet. There are several Yuccas in this garden twenty years old which have not flowered. I believe much depends on soil and situation. I have known some species to flower annually. *A. Watson, Letton Hall, Thetford.*

Iris and lily disease.—I am obliged to your correspondents, Messrs. Jenkins, Tallack, and others, for their notices of my remarks in your columns on this disease. To the former critic I am especially obliged for the information (new to me)

FIG. 58.—GROUP OF FRUITS SHOWN BY HER MAJESTY THE QUEEN AT THE ROYAL HORTICULTURAL SOCIETY'S RECENT SHOW AT THE CRYSTAL PALACE. (SEE P. 440.)

(From a Photograph by Negretti and Zambra.)

that the disease attacked Lilies grown under glass as well as in the open air. Yet this does not really contradict my theory as expressed in your columns. The causes of the disease I hold to be threefold:—1, the ever-presence of spores ready to attack the plants under favourable conditions; 2, damage done to the cuticle of the growing foliage; 3, atmospheric conditions suitable to the rapid development of the fungus. Since the demonstration of the winter-resting spore, it can be shown that at any time in the year, under suitable warmth and moisture, development of the fungus is possible. As regards the Potato disease, this generally happens in July or early in August; in dry seasons, as in 1893, there is no disease except in damp low-lying sites. In wet summers, like 1894, disease is generally prevalent, and always most so when moisture and rank foliage prevail. Your correspondents, Messrs. Tallack and Crook, seem to have noted the same result in regard to Lily disease, i.e., its greatest prevalence in damp places and in wet summers. It would be worth while trying on diseased Lilies the Bordeaux Mixture, so efficacious as regards Potato disease. On the question of the introduction of spores from abroad along with imported Lilies and Iris, it is very possible, and indeed probable, that such may have been the case, and that a fungus different from that which attacks the Potato may have come to us from the Continent. I am not in a position to throw any light on this point. With regard to cause No. 2, I see no reason why it should not operate under glass as well as, or even to a greater extent, than in the open; consider the numerous insects that under glass have to be kept at bay, thrip, green-fly, &c. I think that under glass Lilies receive much more damage to their foliage than in the open, every little puncture must be healed, and that tiny wound is large enough to let in a myriad of spores. If anyone will watch a bed of Potatos in full growth, he may notice swarms of tiny midges or flies (Empteryx) flitting from stem to stem at his approach; examining with a glass the foliage he will find larvæ, pupæ, and imago matured thereon, and careful search will show him a number of minute punctures in the leaf made by these little creatures, punctures ready while healing to admit the fatal spores—this condition of the Potato leaf seems to me exactly parallel to that of the Lily leaf under glass. This year the damage done to Iris foliage by cold and storm was greater than usual, hence, in my opinion, the greater inroad of the fungus; my plants that have been attacked are slowly recovering, and breaking feebly. I notice also, that generally my Iris foliage presents a scorched appearance with withered tips, more or less spotted, hence I infer that the disease (like the Potato fungus) has had a good time of it this year, but has been able only to destroy the young succulent foliage, not the older and tougher leaves, though it has tried its best; further observation is desirable. *Alexander Wallace, Colchester.*

VEITCH'S CLIMBING FRENCH BEAN: A CORRECTION.—I think a clerical error must have crept into Mr. Markham's note on Veitch's Climbing French Bean, printed in last week's *Gardeners' Chronicle*, p. 403. As, I doubt not, what Mr. Markham intended writing was, "I have known (not grown, as printed) this variety for more than thirteen years" (Mr. Markham having been foreman at Longford at the period of time—1881—referred to), and the "cause of its being so long in getting generally known" is owing to the fact of my having, wisely or otherwise, kept the stock of "my climbing Canadian Wonder French Bean" to myself until last year, when it passed into the hands of Messrs. Robert Veitch & Son, Exeter. It was sent out by that firm last spring under the name of "Veitch's Climbing French Bean," and under this name it was awarded a First-class Certificate by the Fruit Committee of the Royal Horticultural Society at Chiswick on the 25th ultimo. I think Mr. Markham has grown this Bean at Mereworth this year for the first time. I may here remark that the Climbing French Bean will flourish in ordinary fertile soil, and under the usual kind of treatment, excepting that if results of the best description are aimed at, supports from 6 to 8 feet high above ground should be afforded the plants when a few inches high, to climb up. *H. W. Ward.*

—— In reference to Mr. T. H. Slade's interesting note on this Bean in *Gardeners' Chronicle*, p. 376, I would advise thin sowing in drills 3 inches deep, preferably running in the direction of south to north at 4 or 5 feet apart, and treating them as regards moulding-up like other Beans. The sticks should be 6 feet high above the ground. I make three sowings; one towards the middle of the month of April, the second a month later, and the last at the middle of the following month. Mr. Slade is right in saying that "those who grow it once will grow it again," and I may add that those who have once cultivated it will always do so. *H. W. Ward, Longford Castle, Salisbury.*

THE OLD ASH AT WOBURN.—This immense tree was rooted up in a storm and cleared away about twelve years ago, about the same time that the famed Silver Fir, a landmark for many miles around, also disappeared, which, when stretched on the ground, measured 130 feet in length, and 14 feet in circumference. There still remain two trees at Woburn worthy of note; one a handsome Oak clothed to the ground with foliage, in the north-east corner of the pleasure grounds, a picture of health 21 feet in circumference; and "The Tall Beech" on Beech Hill near the upper pond in the park, clear of branches for 60 feet, and 14 feet in circumference. *Alex. McKay, late Woburn*, 1894.

FALSE LABELLING OF TOMATOS BY DEALERS.—I trust you will find space for publication of the following grievance (so that we may have the ideas of some of your readers with more experience than myself), namely, that of labelling foreign Tomatos as English, thereby deceiving the public and compelling the English growers to sell at a price (if he must compete), leaving no margin for profit. We hear now of fruit growing as failing to pay. But to my mind if the above grievance does not receive a remedy we shall find it much worse, as the quantities arriving from foreign ports are greatly on increase. I am a grower who sees no reason why it should not be made compulsory to label all foreign fruits. Thanking you in anticipation. *C. H. H.*

HARDINESS OF NICOTIANA AFFINIS.—*Apropos* of Mr. Page's remarks on the above plant, I should like to relate my experience. Last year a large bed in our garden was filled with sub-tropical plants including Nicotiana affinis, and the bed was cleared as usual in the autumn. In April, during the digging of it, my attention was called to a number of roots which had been brought to the surface. Each was furnished with leaf-buds after the manner of Seakale sets. Being anxious to see what kind of plant it would be, about one dozen were planted as a clump and labelled. These turned out to be N. affinis, and they proved more sturdy and floriferous than any of those raised from seed the same year. *A. E. Groombridge, Broms Hall Gardens, Scole.*

—— In answer to Mr. Page on p. 376 of the *Gardeners' Chronicle*, as to the hardiness of the above-named plant, I may say that, when living in Sussex, in 1891, in the summer of that year I planted some seedlings of this plant on a south border, and near the house, but few flowers appeared that summer; the following spring, however, fine clumps appeared, which commenced to flower early, and continued to do so all the summer. In 1893 they again appeared; but to make room for building operations, I was compelled to remove them, and being anxious to save the plants, I removed them to another border, where they soon recovered, and began to flower. They have long fleshy roots. These plants received no protection, and the border was but lightly forked over, as it contained bulbs and other plants. Having gone away from the place with the family, I have quite lost sight of them. I saw it shown as an annual in a 1st prize box in this town. *E. H. Bramhope, Canterbury.*

SOCIETIES.

ROYAL HORTICULTURAL.

October 9.—Notwithstanding the large exhibitions recently held by the Royal Horticultural Society at Chiswick and the Crystal Palace, there was a very extensive show of plants, cut blooms, fruit, and vegetables at the meeting of the committees, held in the Drill Hall, James Street, Westminster, on the above date. Large collections of fruit were conspicuous; and the two merging seasons were linked by good displays of Gladiolus and Dahlias, with exhibits of Chrysanthemum blooms and plants by their side. The weather was foggy, and of a very disagreeable character.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. J. Fraser, J. Laing, H. B. May, H. Herbst, R. Dean, C. T. Druery, Geo. Stevens, C. E. Pearson, E. Beckett, R. Owen, C. J. Salter, C. F. Bause, R. B. Lowe, J. Jennings, P. Barr, C. Jeffries, T. Godfrey, J. D. Pawle, H. Turner, H. J. Jones, Ed. Mawley, and Rev. H. H. D'Ombrain.

A fine exhibit of Crotons was made by Messrs. B. S. Williams & Sons, Victoria and Paradise Nursery, Upper Holloway, London, N. Large and well-grown plants were shown. Williamsii, Disraëli, Bachii, Princess of Wales, with long pendent leaves of green and gold; Bergmanni, a bold form of leaf of white and green; formosus, A. F. Barron, Queen Victoria superba (very brightly coloured), Warreni, and the comparatively new Reidi, also of the same character, &c. There were several Nepenthes bearing pitchers, and a group of the newer varieties of Cannas in bloom. Among the latter were Paul Marquand, and Alphonse Bouvier; both were very desirable varieties. Three plants of Griffinia hyacinthina with strong spikes of Crinum-like flowers of mauve and white were very pretty. The leaves of this Griffinia resemble those of the Eucharis, but are quite erect. The plant is a pretty and attractive subject for the greenhouse (Silver-gilt Banksian).

Messrs. J. Burrell & Co., Howe House Nurseries, Cambridge, again exhibited a capital display of Gladiolus, and among a large number of varieties, three were distinguished with awards:—Casilda is a large cream-coloured flower, with a throat prettily marked with red; grandis is another large and good formed flower—in colour it is very warm intense flesh, with purple marks in the throat; Leonora has sepals of a similar colour to the last-named, with a throat marked with white in addition to the purple (Silver-gilt Floral Medal).

Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, exhibited a very fine collection of herbaceous flowers, in large variety for so late in the season. Pentstemons, Montbretias, Delphiniums, Kniphofias, Achillea, and Scabiosa caucasica, were included, besides numerous varieties of Aster and Helianthemum (Silver Banksian Medal).

Some sprays of Physalis Francheti, with much larger calyx of bright orange colour than the type, were shown by Messrs. Veitch & Sons, Royal Exotic Nursery, Chelsea, and received an Award of Merit (see p. 441). Also a number of plants in flower of Carnation Mdlle. Thérèse Franco, apparently a free-flowering, dwarf-growing variety, with self-coloured blooms of deep pink. Begonia margaritacea, a garden hybrid, is a good variety of the metallic-like leaved section. A large pan was shown. Also some plants in flower of Amasonia punicea, a plant of Gymnogramma Veitchii, described as a supposed hybrid between G. decomposita and G. Pearcei robusta. It is a pleasing variety of graceful appearance, and double the height of G. decomposita and less dense in growth.

Messrs. Cutbush & Son, Highgate, London, N., staged a miscellaneous group of ornamental foliage plants, composed principally of well-grown Dracænas, and in addition was a collection of Calanthe (Pleione) lagenaria in flower, and some plants of Erica verticillata major and E. Bowieana, the former with dark orange-coloured flowers, and the latter with white ones (Silver Flora Medal).

Mr. W. J. Godfrey, Exmouth, Devon, exhibited blooms of a perpetual-flowering Carnation named Miss Mary Godfrey, a white-bloomed variety of considerable merit; also blooms of several other varieties of self-coloured and fancy Carnations (Silver Flora Medal).

A magnificent plant of Vallota purpurea in bloom was exhibited by Mr. Anstiss, Brill, Bucks. It bore about fifty strong flower spikes, with fine large flowers. It has been grown from a single bulb, and potted on without any dividing or thinning. It has been in the present pot for seven or eight years. This pot is about 1½ foot in diameter; and during the summer the plant is placed in the open air, and early in the autumn in a cold house (Silver Banksian Medal).

Roses were shown by Messrs. Wm. Paul & Sons, Waltham Cross, Herts—a dozen or more bunches of Niphetos, and blooms of numerous varieties, in remarkable form for so late a season. Plants of the new garden Rose, Duke of York, and blooms of the same variety were included (Silver Banksian Medal).

A spray of the pretty Poinciana pulcherrima in flower was shown by Jas. Epps, jun., Esq., Upper Norwood.

Mr. J. Crook, Forde Abbey Gardens, Chard, sent a collection of cut flowers, including bunches of Sweet Peas, several good Phloxes, a bunch of Gloriosa superba, &c.

Despite the autumnal weather, the Dahlia yet

lingers unharmed by actual frost. Mr. S. Mortimer, Swiss Nursery, Farnham, set up a collection of eighty-four excellent blooms of show varieties, remarkable for freshness. It was singular to notice that light varieties predominated, the delicately-tinted and yellow varieties being very good. A new show Dahlia named Golden Gem, a deep yellow tipped with pale red, is very promising. It is a fine full flower, and was shown in good form. There were in addition several show boards filled with Cactus varieties very fresh and nice-looking (Silver Flora Medal).

Mr. T. Anstiss, Brill, Bucks, an enthusiastic amateur, had two boards of excellent show Dahlias, as good as are usually to be obtained in September.

Mr. T. S. Ware, Hale Farm Nurseries, had a considerable number of bunches of Cactus, decorative and fancy Dahlias, backed by Michaelmas Daisies, and of the former the following may be named as good late-flowering varieties:—May Pictor, yellow; Matchless, and Lady Penzance (Silver Flora Medal).

A fine and valuable collection of new Japanese varieties of Chrysanthemum was staged by Mr. W. J. Godfrey, nurseryman, Exmouth, and Awards of Merit were made to Madame Charles Molin, a creamy-white variety, having the character of Viviand Morel, which it resembles in build, and is likely to make a fine exhibition variety; to Mrs. E. G. Hill, a large incurved flower, flushed with pink on a pale ground—highly promising; and to Madame Edouard Rey, a very fine, delicately-tinted flower, broad in the petal, and highly refined. Other fine varieties were T. H. Dennis, bright cinnamon, with a buff reverse, a very greatly-improved Val d'Andorre, when at its best; Prefect Robert, deep bright claret-colour, with silvery reverse, good petal, nicely incurving; Le Marquis d'Ayguesvives, the colour of G. C. Schwabe, but a bit brighter, a deep full recurving flower; Marquise de Paris, creamy white, with a pink centre, new three years ago; Exmouth Yellow, a yellow Exmouth Beauty, having the fulness and build of that variety, and a better constitution; Petite Delaux, blush white, shaded with soft rose, fine broad incurving petals; and Mrs. Doctor Ward, orange terra-cotta, with a light reverse.

Mr. W. Wells, Earlswood Nurseries, Redhill, set up a group of plants of new varieties, charmingly arranged with Asparagus, and having an edging of dwarf Pompons. Awards of Merit were made to Souvenir de Petite Aimée, a very large full white variety, regarded as a great improvement upon Beauty of Exmouth; and to Frank Wells, soft pink broad petals, and inclined to incurve. Sir Trevor Lawrence, a large white incurved Japanese; Louise, soft rosy blush, a very fine broad-petalled incurved flower; and President Armand, dark chestnut crimson, with buff reverse, perhaps a little too much incurved, are all very promising (Silver Banksian Medal).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (Sec.), De B. Crawshay, H. Williams, Maxwell T. Masters, H. Chapman, E. Hill, J. Douglas, Sydney Courtauld, Walter Cobb, T. B. Heywood, H. Ballantine, H. M. Pollet, and T. W. Bond.

There was an exceptionally good show of Orchids, which gave a bright appearance to the Hall, notwithstanding the fogginess prevailing. Steadily increasing are the fine exhibits from distant gardens, and the handsome things staged by G. D. Owen, Esq., of Selwood, Rotherham (gr., Mr. Mark Watt), and those from T. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), were good examples for the exhibitors nearer London to imitate. Mr. Owen's three plants were Cattleya labiata "Countess Fitzwilliam," a grand white form with a very delicate pink pencilling on the lip (First-class Certificate); C. labiata Foleyana, a superb large white form, with an orange-coloured base to the lip, and a distinct crimson blotch in front, as in C. Mendelii Morganiæ (First-class Certificate); and the beautiful Lælia præstans alba, which has previously received the highest award. Mr. Statter's best were a fine four-flowered inflorescence of the matchless white C. gigas, and C. Warscewiczii Countess of Derby, whose beauties it is impossible to overestimate. He also showed the richly-tinted Cypripedium × Memoria Moensii, of the C. × Pitcherianum class, but with bright purple crimson upper sepal, broadly banded with white, and red purple petals, also with a fine white margin (Award of Merit); C. × gloriosa (insigne Chantini × Io grande), somewhat resembling a large C. × Ashburtonia; and Cattleya × Minucia.

Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, exhibited another new hybrid in Cattleya × Wendlandii (Warscewiczii ♂, Bowringiana ♀); the plant in growth and in the ample sheathing of its pseudobulbs partakes much of the character of C. Bowringiana, and in the colour and form of its large, neat, handsome flowers, showed traces of that species. The flower was as large as that of C. Percivaliana, of a warm rosy purple, the front of the lip being of a dark crimson, velvety in texture, and the area to the base of the same a chrome-yellow, the front of the tube displaying two yellow discs as in C. Warscewiczii (Award of Merit). Messrs. Veitch also showed Sophro-Cattleya læta (S. grandiflora ♂, L. pumila Dayana ♀), a singularly pretty hybrid. The flower was in form something like that of Sophro-Cattleya × Batemaniana, and consequently more nearly like that of S. grandiflora than the seed-bearer; its sepals and petals are pale red-pink, the base of the lip white, and the front of a shade of rose; Cattleya × Chloris (maxima ♂, Bowringiana ♀), and the handsome Lælio-Cattleya × Nysa superba.

Messrs. F. Sander & Co. staged an effective group of rare Orchids, among which was their new hybrid, Cattleya × Brownii (Harrisonæ × Bowringiana), named in honour of D. S. Brown, Esq., St. Louis, Missouri, U.S.A. The flower in the sepals and petals has a certain resemblance to Lælia majalis, but the sepals were broader, and the whole substance of the flower was thicker and more wax-like. The arrangement of the lip, and the general aspect of the flower, render it very distinct (Award of Merit). Messrs. Sanders' group also contained a fine example of Dendrobium veratrifolium (lineale), with several strong spikes; a well-flowered plant of the rare Catasetum Christyanum, Cycnoches chlorochilon, a very distinct crimson-tipped Pescatorea Dayana, Dendrobium superbiens, Vanda Kimballiana, a fine large-flowered Warrea, also Comparettia macroplectron, Oncidium undulatum, and six very fine forms of Cattleya labiata.

De B. Crawshay, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed the pretty heavily-blotched Odontoglossum crispum Bonnyanum, grown up to his usual high standard.

R. I. Measures, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), sent Cattleya Schofieldiana superba, one of the handsomest forms of C. granulosa, and Cypripedium × lucidum (Lowii × villosum), a very distinct but not showy hybrid.

C. J. Lucas, Esq., Warnham Court, Horsham (gr., Mr. Duncan), exhibited Miltonia spectabilis Moreliana illustris, a very brightly-coloured form; a magnificent Cattleya Hardyana marmorata, with sepals and petals marbled rose and yellow; C. bicolor Wrigleyana, Trichopilia fragrans, and Sarcanthus pugioniformis (Botanical Certificate).

Welbore S. Ellis, Esq., Hazelbourne, Dorking (gr., Mr. Masterton), sent the handsomely spotted Odontoglossum crispum guttatum, Hazelbourne variety; and a pretty brown and yellow Oncidium from Colombia. Walter Cobb, Esq., Dulcote, Tunbridge Wells, showed Miltonia spectabilis Moreliana atropurpurea, perhaps the largest and most richly coloured form yet known (Award of Merit).

Charles Ingram, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), showed Lælia × amœna (pumila anceps), a singular little hybrid, which can be better judged when the plant gets stronger. Admiral Ralph P. Cator, Hazelwood, King's Langley (gr., Mr. G. E. Day), showed Dendrobium Phalænopsis alba, with white flowers, except the front of the lip, which was rose (Award of Merit); the singular Stauropsis philippinense (Botanical Certificate); and Dendrobium bigibbum. J. Bradshaw, Esq., The Grange Southgate (gr., Mr. Wiffen), sent a fine form of Masdevallia Chimæra.

J. Forster Alcock, Esq., Northchurch, Berkhamsted, showed Catasetum fimbriatum. The Hon. Mrs. Foley, Fordingbridge, Hants, sent Dendrobium bigibbum. Messrs. W. L. Lewis & Co., Chase Side, Southgate, staged an extensive and effective group, the most striking plant in which was Cypripedium × Bookeri (ciliolare × Spicerianum), in which the flower is very large and bold, the ample dorsal sepal purple, crimson, and white—a very striking, beautiful, and distinct hybrid (Award of Merit). Their group contained fine forms of Cattleya labiata, Oncidium macranthum, Lælia præstans, Cypripedium Charlesworthii, Oncidium incurvum, Miltonia Moreliana, and the fine old Dendrobium palpebra (Award of Merit); the group securing a Silver Banksian Medal.

Mr. P. McArthur, The London Nurseries, Maida Vale, W., also staged a good group, well associated with slender-growing Palms, Adiantums, &c. In it the varieties of Cattleya labiata showed great variation, from the neat almost white C. labiata delicata to the dark-coloured C. l. Gortoni, which had purple-feathered petals and sepals. In the group also were Cypripedium insigne Gortoni, Cattleya aurea, Lælia tenebrosa, Vanda tricolor, Cattleya Dormaniana, Cypripedium Chamberlainianum macranthum, various Odontoglossums, Dendrobiums, &c. (Silver Banksian Medal).

Messrs. Charlesworth, Shuttleworth & Co., Heaton, Bradford, had a group in which the many forms of Cypripedium Charlesworthii formed the chief attraction. In it, too, were the best form of Miltonia Bluntii Lubbersiana we have seen; a fine plant of the handsome Cypripedium × Chas. Richman, two good specimens of Dendrobium ciliatum, &c. (Silver Banksian Medal).

Messrs. Hugh Low & Co., Clapton, showed some fine plants of Cattleya labiata, a good C. maxima, and three very distinct forms of Cypripedium Charlesworthii. Arnold Witt, Esq., Maida Vale, sent a large plant of Cypripedium bellatulum and one of C. Charlesworthii; and F. Wheatley, Esq., Ringmore, Teignmouth, sent a spike of a very pretty light form of Cattleya Dowiana aurea.

Fruit Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. T. F. Rivers, G. Bunyard, W. Wilks, J. Cheal, A. Young, T. J. Saltmarsh, C. W. Cummins, A. H. Pearson, J. Wright, A. Dean, J. A. Laing, W. Bates, G. Wythes, J. Hudson, F. Q. Lane, G. T. Miles, G. Norman, E. Gilman, J. Willard, and W. Balderson.

To show how well Pears can be grown on shallow soil, A. H. Smee, Esq., The Grange, Wallington (gr., Mr. Cummins), exhibited an astonishingly fine collection for an amateur. In all there were 123 different varieties, a selection of the Pears which have good quality to recommend them in ordinary seasons when grown in this country.

The year has not been a good one for Pears, especially in a somewhat overmoist soil like that at the Grange, and the fruits were not of their normal size in many instances, but they were perfect and without blemish, which indicates, as we believe, the adoption by the gardener of the newer methods of combating fungous growths and insect attacks. Of the rarer varieties we may specify Rousselet, Rousselet Enfant Prodigue, Dr. Trosseau, Beurré Audusson, B. Nantais, B. de Rohan, B. van Mons, and B. Tuerlinckx, Colmar d'Eté, Mondaga, Pius IX, Commissionaire de Lille, Passe Crassane, General Dutillieul, Frederic Leclerc, Orange Bergamot, Bonne d'Aran, Henri IV., Alexandre Lambre, Doyenné Seuille, Leopold I, Bouvier, Henriette Bouvier, Anna Nelis, America, Duchesse de Mars, Comte de Paris, and Bergamot Hertrich. An Award of a Silver Knightian Medal was made.

The Duke of Northumberland, Syon House, Brentford (gr., Mr. G. Wythes), made an extraordinary display of Pears and Apples, consisting of the best-flavoured or showiest varieties for size and colour, grown in this country. The fruits were examples of good culture, and well deserved the Silver-gilt Knightian Medal that was awarded. Melon Champion and others came from the same gardens.

Mr. H. Berwick, Sidmouth Nurseries, Sidmouth, had an extensive collection of fruits in baskets and plates, comprising the best-known varieties of Apples and Pears, the former being in the greater number (an award of a Silver Knightian Medal).

A very meritorious collection of Apples came from Messrs. Peed & Son, Roupell Park Nursery, Streatham, Surrey (Banksian Medal).

Dowager Lady Freake, Fulwell Park, Twickenham (gr., Mr. A. H. Rickwood,), had a collection consisting of choice varieties of Pears and Apples, much of which was undersized (Silver Banksian Medal).

Mr. Empson, gr. to Mrs. Winkfield, Ampthill, Beds, exhibited very superior examples of Carrots, Sutton's New Intermediate, Carter's Summer Favourite, and a good selection of the Long Surrey (Silver Banksian Medal).

From Messrs. Laxton, Bedford, came the Onion Sandy Prize, a nice not overgrown bulb, and grown under ordinary methods; a new seedling Plum said to be a cross between Golden Drop and October Yellow. It has some of the flavour of the former, and a tough skin, will certainly keep for several weeks after being gathered, and might prove a good drying variety.

Mr. Henry Appleby, Dorking, showed shoots of Diamond Plum, with a second crop of half-ripe fruits on them.

Some very large Doyenné du Comice Pears came from Messrs. T. F. Rivers & Sons, Sawbridgeworth, and specimens of the valuable late Golden Transparent Plum (Vote of Thanks).

A most extensive lot of garden produce was shown by Messrs. H. Cannell & Sons, Swanley, Kent. This consisted of thirty-four varieties of Onions, most of Deverill's varieties; also Nutting's Golden Ball, Inwood Favourite, Lullingston Park Hero, Neal's Advancer, Royal Jubilee, Cannell's Globe, and others. These Onions were all of extra size, and selected for seed-saving purposes. Other exhibits were Early Rose Celery, a quantity of very fine examples of Carrots, including James' Improved, several of the so-called stump-rooted varieties, so well adapted for shallow land; Coleworts, Savoys, good Egyptian Beetroot, &c.—good things shown in much abundance (Silver Knightian Medal).

A prolific oval-fruited Tomato, "Farr's All the Year Round," was shown by A. Pearr, Esq., Spring Grove, Isleworth (gr., Mr. Farr). The plants, growing in pots, were loaded with fruits in various stages of development, from the bottom to the top.

From Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, came a large assortment of Savoys, in size from the gigantic Drumhead down to the more delicate-flavoured small Early Dwarf Ulm. We remarked the varieties De Vertus, Late Green, Gilbert's Universal Hâtive d'Aubervilliers, and Golden Yellow (Silver Banksian Medal).

ROYAL HORTICULTURAL SOCIETY'S FRUIT SHOW.

September 29, *and October* 1 *and* 2.

We give a few additional details for which we had no space in our last issue.

Miscellaneous Flowers and Vegetables.

What must be regarded as almost the last appearance of the Dahlias in the present year was seen on this occasion, represented by several collections of a high order of merit, that offered charming patches of colour here and there, and considerably relieved the monotony of table after table of dishes of fruit, which, while of great interest to growers, are a little wearisome to the general public. Mr. F. W. Seale, Vine Nursery, Sevenoaks, put up a very large and imposing display, in which all classes of the Dahlia were seen to great advantage unusually late in the year. It was a striking feature in the western nave, and it is to be regretted such a large and excellent exhibit failed to secure any award from the Society. Mr. W. Wells, Earlswood Nurseries, Redhill, had plants of his excellent new early-flowering Pompon Rose Wells, which appears to be an almost perpetual bloomer; and, in addition, a collection of over fifty blooms of fine Japanese Chrysanthemums.

Messrs. B. S. Williams & Son, Victoria Nurseries, Holloway, had a group of dwarf Cannas in flower; Comte de Bouchard, Madame Crozy, and Admiral Gervais were all good. Mr. Charles Turner, Royal Nursery, Slough, had blooms of Decorative Dahlia Mrs. Turner. Messrs. Cutbush & Son, nurserymen, Highgate, had a large central table filled with cut flowers of a hardy character, Carnation Mrs. L. de Rothschild, in excellent condition, and Pink Ernest Ladhams, set off by a fringe of fruit.

Mr. B. Ladhams, nurseryman, Shirley, Southampton, had a collection of bunches of hardy cut flowers, and a considerable number of blooms of his fine new Pink, Ernest Ladhams, which appears to flower through a considarable portion of the year.

Messrs. H. Cannell & Son, nurserymen, Swanley, had bunches of Cactus and Pompon Dahlias of a very attractive character, a bank of excellent double Begonias, mainly yearly seedlings, and Cockscombs also.

Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley, also had a very fine collection of Dahlias of surprising quality for so late a period of the year—nearly fifty bunches of Pompon, sixty of Cactus, and a large number of singles; a collection that was singularly bright and effective.

Messrs. Sutton & Sons, Reading, had very fine pods of their A 1 Runner Beans, a variety with a rough skin, carrying more weight per plant than Prizewinner, a Bean that was also shown—a long narrowish pod, with a smooth skin, the ripe seeds light purple with a few dark spots; it is a selection from the ordinary Scarlet Runner, but of which not 1 per cent. run back.

Some ripe ordinary Alpine Strawberries were shown, red and white, from plants grown from seeds sown on April 13, 1893; also Sutton's Improved Alpine, with longer and larger fruits grown in the same manner. This method of raising Alpine varieties is not new, but is seldom practised now-a-days, although it is known that seedlings possess greater vigour than plants from runners, and there is always a chance that something better may turn up amongst them.

Mr. Jerome, Tedding, showed the purple-podded Runner Bean about which such an unnecessary fuss is being made in some of the London daily papers.

Mr. Henry Deverill, seedsman, Banbury, had a large collection of wonderful Onions, Ailsa Craig in particular being very fine; the large size and handsome appearance of the bulbs attracted a good deal of attention from visitors.

Dried Fruits not Preserved in Sugar.

In this competition only two exhibitors were remarked—Mr. W. A. Trotter, gr., Broomboro Place, Ledbury, and Colville Browne, Esq., Horticultural College, Swanley, Kent. The first-named, the winner of the 1st prize, had, for English produce, a very excellent collection of dried fruits, herbs, &c., which capitally illustrated a certain way in which our fruits, surplus or other, can be put to a better use than sending them to glutted markets at unremunerative prices. The various articles were in all respects as good as those we obtain from the foreigner—if we say no more. They are grown for sale in small lots, say, of 12 lb. and over, as also in bulk, and the prices are, as we were given to understand, very moderate relatively to those of fresh green fruits, or to that which is imported from abroad. We remarked, shown in 1 lb. quantities, Apple-rings, quarters, whole, whole with the core punched out. Some of the above were specified, such as Flower of Herts, Hawthornden, and Golden Noble, and some had been dried in 1893, and some this year, the only difference observable being a slightly darker tint in the fruit of last year. These Apples would be the equal of Normandy Beaufins. The same exhibitor showed Plums dried in 1 lb. boxes as for sale, Washington, Greengage, Golden Gage, Dymock, Victoria, Magnum Bonum, Mussel, fruits of 1893 and 1894; also Damsons of 1891 and 1894; Black Currants, Pears, whole and in halves. Figs, Morello Cherries, and Peaches of 1894. The Plums of all varieties were especially appetising in appearance, with skins unbroken, and the equal of the continental Prunes. We should not let our prejudices stand in the way of making use of such excellent comestibles. Dried vegetables formed another exhibit from Mr. Trotter, and these consisted of Scarlet Runner and French Beans, Green Peas, Tomatos, and Asparagus; also Lemon Peel (a Silver-gilt Medal accompanied this prize).

The fruits and vegetables were dried by Dr. Ryder's patent evaporator, the same which was shown at Chiswick a year or two ago. The 2nd prize fell to Colville Brown, Esq., Horticultural College, Swanley.

Miscellaneous.

Messrs. Tasman & Son, Sun Court, Barbican, London, exhibited refrigerators suitable for the preservation of fruit, also boxes for sending fruits to market, &c.

Mr. J. George, 10, Victoria Road, Putney, had a stand containing a great variety of horticultural sundries, peat, &c., for potting purposes, and many kinds of insecticides, and manures. Some bunches of Gros Colmar Grapes grown by Mr. Thomson of Clovenfords, and which had been treated with his Vine and plant manure, were remarkable for the unusual size of the berries.

BIRMINGHAM GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

October 8.—The first autumn meeting of the Birmingham Gardeners' Mutual Improvement Association was held in the Athletic Institute on the above date. Mr. W. B. Latham, Curator of the Birmingham Botanical Gardens, in the chair.

A paper was read by Mr. John Pope, nurseryman, on the Dahlia, with special reference to its new development, as well as to the more primitive forms of the genus brought from Mexico to Europe. Mr. Pope exhibited examples of several special varieties to illustrate his subject, conspicuous amongst which were D. picta formosissima and D. gracilis, which latter he has continued to cultivate ever since he introduced it from France some twenty years since, as a type of a single scarlet Dahlia. Incidentally also he mentioned the interesting fact that the first Pompon Dahlia named Little Wonder was raised at Handsworth, near Birmingham, about thirty-five years ago by a Birmingham button-maker named Smith, who was a great enthusiast in growing several kinds of florists' flowers. Amongst the various exhibits, most interesting was a flower of the new tubular-petalled Dahlia, Grand Duke Alexis of Russia, sent by Messrs. Cannell, of Swanley, and which coincidentally was so strikingly figured in the *Gardeners' Chronicle* last week.

In the interesting discussion that followed the essayist, not the least amusing was the reference to the phonetic pronunciation of the word Dahlia, and in which Messrs. Bick, W. Gardiner, and Spinks took prominent part. The proceedings were enlivened by collections of Dahlias, comprising several of the newer varieties, sent by Messrs. Turner of Slough, Perkins of Coventry, Keynes of Salisbury, Mazlett of Worcester, and Pope of King's Norton; whilst Hewitt & Co. of Solihull contributed a box of splendid Begonia blooms, tastefully arranged with sprays of Maidenhair Ferns; also a collection of Michaelmas Daisies and hardy herbaceous flowers. An interesting future in the proceedings was the distribution of the prizes in the shape of valuable books pertaining to horticulture offered by the association to gardeners (members), for essays on the cultivation of a supply of vegetables for a family throughout the year. The selection of the books was left to the winners individually. *W. G.*

NATIONAL CHRYSANTHEMUM.

October 10, 11, 12.—The second show of this society held during the present season was opened on Wednesday last in the Royal Aquarium, Westminster. Exhibits of Chrysanthemums were not numerous, but some of the blooms were of splendid quality, notably in the open class, for twenty-four flowers. Miscellaneous exhibits, as is usual at these early shows, were in excess of those strictly within the province of a society devoted to Chrysanthemums.

In the competition for a group of Chrysanthemums and foliage plants arranged for effect, the 1st prize was taken by Mr. W. Wells, Earlswood Nurseries, Redhill, Surrey, with a similar group to that noticed from this exhibitor at the Drill Hall on the previous day. The group was very thinly composed of dwarf plants carrying in most cases a single bloom, and interspersed with Ferns, &c. Mr. Geo. Stevens, St. John's Nursery, Putney, was 2nd with a much more closely packed group. Mr. W. Wells was 1st for twenty-four blooms of Japanese in not less than eighteen varieties, and showed very fine blooms, his best were, W. H. Lincoln, Ed. Molyneux, Chas. Shrimpton, Madame Thérèse Rey, Kentish Yellow, F. W. Flight, Edith Rowbottom, and William Tricker; 2nd, Mr. W. Collins, gr. to J. W. Carlile, Esq., Ponsbourne Park, Hertford, who had good blooms of Madame Thérèse Rey, Mrs. E. W. Clarke, E. Molyneux, President Borel, and S. C. Schwabe; 3rd, Mr. Chas. Cox, gr. to Jno. Trotter, Esq., Brickendon Grange, Hertford.

The 1st prize for twelve Japanese blooms, distinct, was taken by Mr. E. Rowbottom, gr. to H. R. Williams, Esq., The Priory, Hornsey, N. His best were Primrose League, Mrs. E. W. Clarke, Utopia, Madame Thérèse Rey, Edith Rey, and Commandant Blusset, all of which were good; 2nd, Mr. W. Wells; and 3rd, Mr. W. Collins.

Incurved blooms were rather small, and only partially developed. The best prize for twelve blooms went to Mr. E. Rowbottom, and the best of those staged were Baron Hirsch, Mons. R. Bahuant, and Jeanne d'Arc; 2nd, Mr. Jas. Agate, nurseryman, Havant, Hants; 3rd, Mr. W. Wells.

Pompons were only exhibited by Miss Debenham, St. Peters, St. Albans; and a 2nd prize was awarded this exhibitor for twelve bunches and six bunches respectively in the section.

Amongst the amateurs a 1st prize went to Mr. Wm. Amies, South Ashford, Kent, for six good blooms of Japanese, including E. Molyneux, and M. Tenard, most noteworthy; Miss Anne L. Gaunt, Hilderthorpe, Philip Lane, South Tottenham, was 2nd; and Mr. H. Wedekind, 13, Warloch Road, Paddington, W., 3rd.

The best twelve blooms of Japanese shown by "single-handed" gardeners, was exhibited by Mr. E. Tickner, gr. to Jno. Watney, Esq., Shermanbury House, Reigate, who had a fairly good lot, but the blooms were very unequal, and some were poor; 2nd, Mr. T. L. Turk, gr. to T. Boney, Esq., Cholmeley Lodge, Highgate, N.; 3rd, Mr. T. Knapp, gr. to F. W. Amsden, Esq., 22, Chichester Road, Croydon.

In a class for six blooms, distinct, of any new

varieties sent out during 1893 and 1894, for which a special prize was offered by Mr. H. J. Jones, the 1st prize was taken by Mr. W. Wells, with blooms of F. W. Sanders, Louise, Miss Dorothy Shea, W. Seward, Chas. Davis, and Frank Wells; Mr. Jas. Agate was 2nd.

Florists' arrangements always form a feature at these shows, and on this occasion they were very good, as well as numerous. The 1st prize in the open class for a table of bouquets, wreaths, sprays, &c., illustrating the decorative value of Chrysanthemums, was taken by Mr. J. R. Chard, Stoke Newington, with a tasteful arrangement. Mr. L. H. Calcutts, Stoke Newington, had also a capital exhibit. Mr. J. R. Chard was 1st for three epergnes of Chrysanthemums suitable for the dinner-table; and Mr. D. B. Crane, 4, Woodview Terrace, Archway Road, Highgate, London, 2nd; Mr. F. W. Seale, Sevenoaks, was 3rd. The 1st prize for a single vase was taken by Mrs. E. Beckett, Aldenham Road, Elstree, Herts.

MISCELLANEOUS.

Amongst the miscellaneous exhibits that we can only briefly notice were a collection of Asters, and Apples and Pears, and some well-finished bunches of Lady Hutt and Appley Towers Grapes, from Messrs. Wm. Cutbush & Sons, Highgate Nurseries, London, N.; some Apples and Pears from Mr. Alfred Wyatt, market gardener, Hatton, Middlesex; a collection of Apples and Pears from Messrs. S. Spooner & Sons, Hounslow; a large collection of vegetables and flowers from Messrs. Cannell & Sons, Swanley; a collection of Apples and Pears, including 250 dishes from Messrs. Jno. Laing & Sons, Forest Hill, London, S.E. Messrs. J. Cheal & Sons, Crawley, had a collection of Dahlia blooms; and Mr. S. Mortimer had another exhibit of Dahlia blooms. Messrs. J. Burrell & Co., Cambridge, had a display of Gladiolus. Mr. H. Berwick, Sidmouth, Devon, a collection of fruit; and Messrs. B. S. Williams & Son, Upper Holloway, London, N., an exhibit of fine Crotons. Mr. H. J. Jones, Ryecroft Nursery, Hither Green, Lewisham, London, S.E., had a collection of Chrysanthemum blooms, including some promising seedling varieties; Mr. E. Rowbottom had twenty-four blooms of Chrysanthemums. Mr. W. Wells had also a few Chrysanthemums; and exhibits of a similar nature were from Mr. W. J. Godfrey, Exmouth; Mr. Thos. Amies, and Mr. E. George Reid, Sydenham, London, S.E. Mr. T. S. Ware, Hale Farm Nursery, near Tottenham, had a collection of Asters and Dahlia blooms; and Mr. H. Deverill, Banbury, a collection of Onions. Messrs. Edwards & Son, Sherwood, near Nottingham, had a stand of their decorative pots, made of conglomerate wood and metal; and another stand was devoted to Haines' Patent watering-cans, from Lea Bridge Road, Clapton, London, N.E. Chrysanthemum cups and tubes exhibited included the Beckett, the Springthorpe, the Champion, and the Shoesmith.

Many of these exhibits were shown at the Royal Horticultural Show at the Crystal Palace, or at the Drill Hall.

Obituary.

MRS. FORBES ROYLE.—On Oct. 3, at Gastein, Gypsy Hill, after a brief illness, aged 77, ANNETTE, daughter of the late Edward Solly, of Curzon Street, Mayfair, and widow of the late John Forbes Royle, M.D., F.R.S. Mrs. Royle largely shared her husband's labours, and especially the preparation of the two folio volumes "Illustrations of the Botany of the Himalayan Mountains." The copious analytical indexes to these volumes were compiled entirely by Mrs. Royle, as she told us, who devoted fourteen hours a day to them for three months. Mrs. Royle was the sister of the late Prof. Ed. Solly, a well known chemist in his day, and who, like Dr. Royle, was intimately connected with the Horticultural Society in bygone years.

CANARY SEED CULTURE IN TURKEY.—Canary seed is stated to have been exported last year from Gallipoli to the extent of 18,500 quarters. At the commencement of the season the seed realised £1 10*s.* the quarter, free on board, in sacks, and ran up, owing to the strong demand, to £2 2*s.* The farmers have grown Canary seed in preference to Wheat, and this year's harvest is expected to be double that of last year.

MARKETS.

COVENT GARDEN, October 11.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

POTATOS.

Supplies have not been as heavy during the past week, and consequently prices have tended upwards for most samples. Prices:—Snowdrops, Beauty of Hebron, and Main Crop, 80*s.* to 100*s.*; Magnum Bonum, Bruce, and Giants, 70*s.* to 80*s.*; Ordinary samples and Blacklands, 47*s.* 6*d.* to 60*s.* per ton. *J. B. Thomas.*

FRUITS AND VEGETABLES.

BOROUGH AND SPITALFIELDS: *October* 9.—Quotations:—Cabbages, 1*s.* 6*d.* to 2*s.* per tally; Turnips, 1*s.* 6*d.* to 2*s.*; Carrots, 1*s.* to 2*s.*; Parsley, 9*d.* to 1*s.* 6*d.* per dozen bunches; Beans, Scarlet, 1*s.* 3*d.* to 1*s.* 9*d.* per bushel; Horseradish, 1*s.* to 1*s.* 6*d.* per bundle; Onions, foreign, 2*s.* to 3*s.* 6*d.* per bag; do., English, 3*s.* 6*d.* to 4*s.* 6*d.* per cwt.; Apples, English, 2*s.* to 6*s.* per bushel; Pears, 9*d.* to 3*s.* 6*d.* per half bushel.

STRATFORD: *October* 9.—The supply to this market during the past week has been excellent, and with a large attendance of buyers a brisk trade was done at the undermentioned prices:—Cabbages, 1*s.* 6*d.* to 2*s.* per tally; Cauliflowers, 6*d.* to 10*d.* per dozen; do., 3*s.* to 4*s.* per tally; Turnips, 1*s.* 6*d.* to 2*s.* per dozen bunches; Carrots, household, 27*s.* 6*d.* to 42*s.* 6*d.* per ton; do., cattle-feeding, 20*s.* to 30*s.* do.; Mangels, 10*s.* to 17*s.* do.; Swedes, 14*s.* to 19*s.* do.; Onions, English, 3*s.* 6*d.* to 4*s.* per bag; do., Dutch, 2*s.* to 3*s.* do.; Apples, English, 2*s.* to 5*s.* per bushel; Watercress, 6*d.* per dozen; Damsons, 2*s.* to 3*s.* per half-sieve; do., 4*s.* to 4*s.* 6*d.* per flat; Cucumbers, frame, 1*s.* to 1*s.* 6*d.* per dozen.

FARRINGDON: *October* 11.—Quotations: Cauliflowers, 1*s.* per dozen; Celery 9*d.* do; Beetroots, 6*d.* do; Beans (Scarlet), 2*s.* per bushel; Sprouts, 1*s.* 9*d.* per bushel; Horseraddish, 1*s.* per bundle; Cucumbers, 1*s.* 6*d.* per doz.; Tomatos, 4*s.* per dozen; Marrows, 1*s.* per dozen; Cabbages, 1*s.* 6*d.* to 3*s.* per tally; Collards, 1*s.* 3*d.* to 2*s.* 6*d.* do.; Greens, bunch, 1*s.* to 1*s.* 6*d.* do.; Turnips, 1*s.* 6*d.* to 2*s.* per dozen; Carrots, bags, 1*s.* 9*d.* to 2*s.*; Apples, cooking, 4*s.* to 6*s.* per bushel; Pears, stewing, 2*s.* to 3*s.* do.

SEEDS.

LONDON: *October* 10.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended, with little business doing. English winter Tares find buyers at the surprisingly low rates now accepted. Sowing Rye steady. Clover seeds neglected. Rye-grasses drooping. Home-grown Mustard and Rape seed offer cheap. French Buckwheat sells freely. Peas and Haricots in improved request. Canary seed moves off slowly on former terms. Linseed unchanged.

POTATOS.

BOROUGH AND SPITALFIELDS: *October* 9.—Quotations ranged from 45*s.* to 80*s.* per ton.

STRATFORD: *October* 9.—Quotations:—Magnums, Darkland, 40*s.* to 55*s.*; do., Light-land, 45*s.* to 60*s.*; Sutton's Abundance, 55*s.* to 75*s.* per ton.

FARRINGDON: *October* 11.—Quotations:—Hebrons, 60*s.* to 80*s.*; Bruces, 60*s.* to 70*s.*; Essex Magnums, 60*s.* to 70*s.*; Imperators, 50*s.* to 60*s.*; Rounds, Essex, 55*s.* to 70*s.* per ton.

LONDON AVERAGES: *October* 10.—Snowdrops, 80*s.* to 95*s.*; Hebrons, 70*s.* to 80*s.*; Kidneys, 60*s.* to 75*s.*; Magnums, 55*s.* to 65*s.*; Black-lands, 45*s.* to 55*s.*; Maincrop, 80*s.* to 90*s.*; Champions, 50*s.* to 60*s.*; rounds, 45*s.* per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 75*s.* to 135*s.*; do., inferior, 45*s.* to 120*s.*; hay, best, 60*s.* to 130*s.*; do., specially picked, 138*s.*; do, inferior, 36*s.* to 68*s.*; Mixture, 90*s.* to 120*s.*; and Straw, 22*s.* to 40*s.* per load.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending October 6, and for the corresponding period last year:—1894: Wheat, 18*s.* 2*d.*; Barley, 23*s.* 7*d.*; Oats, 14*s.* 1893: Wheat, 27*s.* 10*d.* Barley, 29*s.*; Oats, 17*s.* 10*d.*

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending October 6, is furnished from the Meteorological Office :—

"The *weather* during the early part of the week was mostly fair and dry, though with a good deal of cloud and mist in places. Later on, the conditions became less settled, a little rain occurring at most of the eastern, central, and southern stations, and some rather decided falls on the south-east coasts of England.

"The *temperature* was slightly above the mean in 'England, E.,' and just equal to it in 'Scotland, N. and Ireland, N.' In all other districts there was a deficit, amounting to one or two degrees. Highest readings were recorded mostly during the early part of the week, when the thermometer rose to between 62° and 65° in all districts, excepting 'England, E.' Lowest readings were also observed, as a rule, some time early in the week. Frost occurred in all districts, excepting 'Scotland, N.,' 'England, E. and S.,' and the 'Channel Islands;' in 'Scotland, E. and Ireland, N.,' the sheltered thermometer fell to 28°.

"The *rainfall* was very deficient in all districts. In 'England, N.W. and Ireland, S.' there was none at all, and in all the other grazing districts, as well as in 'Scotland, N.,' the amount was exceedingly slight.

"The *bright sunshine* was in excess of the average in 'Ireland, Wales, the western parts of England, and the north of Scotland,' and equalled the normal in 'England, N.E.' Elsewhere there was a deficiency; the absence of sunshine being mostly marked in 'England, E. and S.' The percentage of the possible duration ranged from 39 in 'England, S.W.,' and 36 in 'Ireland, S.,' to 19 in 'Scotland, W.,' and to 16 in the 'Midland Counties.'"

Answers to Correspondents

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** Plants, Fruits, etc., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

Bean: *W. S.* Without seeing the whole plant and ripe pods we cannot say with certainty what it is. It has some resemblance to the purple-podded Runner Kidney Bean (Haricot à Cosse Violette of the French).

British Fungi: *Correspondent.* Dr. Cooke's *Plain and Easy Account of British Fungi* is to be had from W. H. Allen & Co., 13, Waterloo Place.

Blechnum *v.* Lomaria: *D.* (see p. 401). We have specimens from Kew, and have also examined our own dried Kentish specimens. In all the sori and indusium are all well within the margin, hence the species is correctly placed in Blechnum.

Cone of Cedar of Lebanon: *F. M.* You cannot extract the seeds, which lie at the base of the scale, unless the cone is opened under the action of sunshine, or forcibly pulled to pieces. If it should open of itself, the seeds could be shaken out, and the cone soaked in water and afterwards bound together with thin wire it would preserve much of its natural appearance.

Fruit Culture in Canada: *E. H. W.* Before you do anything in fruit-farming it would be the most prudent course to pursue for both of you to obtain situations in either commercial or private gardens, preferably the former. You might stay in such situations a year or two before deciding on a locality for your venture. Advertise in this journal, and in the *Northern Messenger* at Montreal, *Rural Canadian* at Toronto, and *North-Western Farmer, Manitoba Miller* at Winnipeg, or the *Canadian Horticulturist*, Ontario.

Fuchsia: *Fuchsia.* The plant, having bloomed once, will not do so again the same year, and it requires, towards this season, a gradually withholding of water at the roots, and cool treatment; and when the leaves turn yellow it should be stood away in a cellar or unoccupied room, where there is no warmth to excite it into growing again till February. It must not be allowed to get dust-dry at the roots.

Fungi: *A. C. F.* 1, Fomes annosus, Fr.; 2, Same species as No. 1; 3, Agaricus (Pleurotus) ulmarius, Fr.; 4, Too much broken to determine; 5, Peziza calycina, Fr.; 6, Nothing found with this number; 7, Cenangium ferruginosum, Fr. *M. C. Cooke.*—*Alnwick.* The fungus is the commencement of Fumago vagans, Pers., which, if allowed to extend, will cover the leaves more or less with a black film. Remove and burn all affected leaves, or if all are attacked, wash the surface with a solution of soft-soap. *G. Massee.*

Grapes, White Lady, Downes': *N. F.* The appearances point to the use of flowers-of-sulphur in excess, or exposure of the bunches to cold air.

Grapes: *Anxious One.* Next week.

"Index Kewensis" and "Baker on Lilies": *T. Godwin, Sydney, N.S.W.* There are two parts of the Index already published, and the third part will appear shortly. The publishers are the Oxford University Press, Amen Corner, London, E.C. Price per part, 2 guineas. We do not think that the monograph of Lilies has appeared separately. It is probable that a copy might be obtained at the Linnean Society, Burlington House, London. We do not know the price of a copy.

Labels: A Correction.—In our last issue, relating to a new form of label, we stated that the shank was made of zinc, and that corrosion with the brass clips would probably occur. We are informed that this danger is averted, as the shank is really of galvanised iron.

Landscape Gardening, &c.: *A Young Gardener.* If you intend to follow landscape work as a means of getting a livelihood, you should place yourself under some landscape gardener of acknowledged ability, paying a premium. You would require to have a knowledge of land surveying, plan-drawing, and levelling, together with a thorough acquaintance with trees, shrubs, and garden plants generally, forestry, and cognate subjects; and more than all, you should have ideas—in fact, you should be an artist or you will never be more than a copyist. You should advertise your requirements if you have no friends to put you in the way of obtaining them, American papers of note are, *Garden and Forest, American Gardening, Gardening*, and *Meehan's Monthly*, but almost every State has its own gardening and farming journal. The conditions of service are very different to what hold in this country, and if the salaries paid are larger than at home, the hours are longer and the cost of living much higher. Openings are fairly numerous in the older States.

Names of Fruit: *C. C.* Pear Beurré d'Amanlis.—*A. W. G.* 1, Beurré Hardy; 2, Fondante d'Automne; 3, Louise Bonne of Jersey; 4, not recognised; 5, Duchesse d'Angoulême; 6, Maréchal de la Cour.—*Dartnell & Co.* 86, Annie Elizabeth; 39, Catshead; 58, Stone's Apple; 81, Blenheim Orange; 45, Cox's Pomona (?).—*W. S.* 1, Catshead (?); 2, New Hawthornden; 3, Grange's Pearmain; 4, Wormsley Pippin. Pears: 2, Marie Louise; 3, Beurré d'Amanlis; 7, not known.—*A Constant Reader.* 1, Beurré Hardy; 2, Thompson's; 3, not known; 4, Old Crassane; 5, Winter Nelis; 6, Glout Morçeau.—*Colossal.* Specimens not sufficiently good.—*A. W.* 1, Easter Beurré; 2, Beurré Diel; 3, Bergamotte Esperen; 4, Doyenné du Comice; 5, Glout Morçeau; 6, Beurré de Capiaumont.—*Geo. Abbey.* 1, Beurré Superfin; 2, Brown Beurré; 3, Duchesse d'Angoulême; 4, Maréchal de la Cour; 5, not recognised; 6, Beurré Bosc.—*W. Newton.* 1, Flemish Beauty; 2, Glout Morçeau; No. 3 missing, two No. 4's; the long fruit Marie Louise, the short one Beurré Superfin; 5, Beurré Rance; 6, Williams' Bon Chrétien. *W. H. D.* Apples, most probably Duchess of Oldenburgh; Pears: 2, Marie Louise; 4, Beurré Diel; others not known.—*A. Chapman.* Plum, Belle de Septembre.—*B. Wells.* Merely wrapped in newspaper, your crabs were so pulped that we are unable to say what they may be. Send better packed specimens.

Names of Plants: *W. W., N.B.* 1, Helianthus rigidus; 5, Vanda tricolor; 6, Cattleya bicolor.—*J. W. A.* Monstera deliciosa (Philodendron pertusum). It is rather late in the year for the plant to ripen its fruit satisfactorily. Let it have full light, and a warmth of not less than 60° by night and 70° by day, which, if the plant be in a tub or large pot, could perhaps be afforded it in a forcing-house. It is not likely to ripen at all in the conservatory.—*F.* Not the common Pinus Laricio, but the var. Pallasiana.—*W. G. N.* Your flower is that of Dendrobium superbiens; we know of no variety by the name of Sumneri.—*A. J. C.* 1, Cypripedium Hookeræ Bullenianum; 2, probably Oncidium Batemanianum; send when in flower.—*J. J., Pendleton.* 1, Cœlogyne fuscescens; 2, Pholidota pallida; 3, perhaps a small piece of Cœlogyne cristata; 4, Eria species; send when in flower.—*E. F. H.* 1, Eupatorium ageratoides; 2, Eupatorium Weinmannianum; 3, Eupatorium riparium; 4, Cyperus longus, variety. Cucumber roots; yes, eel-worms.—*H. B. E., Clifton.* Catasetum Christyanum, a very singular and rare species.—*X. Y. Z.* 1, Pittosporum tenuifolium; 2, Abies Lowiana; 3, Abies Pinsapo; 4, Catalpa syringæfolia; 5, Azara microphylla.—*W. J. P.* 1, Spiræa Thunbergii; 2, Taxodium distichum (the deciduous Cypress); 3, Alnus glutinosa var. laciniata; 4, Cotoneaster frigida; 5, uncertain, perhaps Celtis occidentalis; 6, Rhus Cotinus.—*T. I. & Sons.* Cotoneaster frigida.—*H. J.* 1, Alonsoa incisa; 2, Sedum carneum variegatum; 3, Rhododendron jasminiflorum; 4, Asplenium bulbiferum biforme.—*J. C. G.* Fungi (next week). 1, Eriobotrya japonica; 2, not found; 3, Ophiopogon Jaburan, fol. var.; 4, Litobrochia biaurita; 5, Adiantum macrophyllum.—*A. M. D.* Dendrobium Cœlogyne, D. denudans (the small green flower), and Calanthe biloba. *R. A. R.*

Onions Diseased: *E. Riley, Hull.* See p. 160, August 11.

Pears, Cracking: *F. K. & Co.* The Pears crack because they are attacked by a fungus—Fusicladium dendriticum. In consequence of the attack, the outer tissues die, or do not grow so fast as the inner tissues, and cracks consequently occur. Spraying with Bordeaux Mixture two or three times in the season before the flowers expand fully, will prevent the disease. The fungus attacks the leaves also.

Pteris Fronds Disfigured: *J. D.* The work of a minute snail.

Seedling Apples: *J. E. Nelson.* Not considered equal to many sorts now in cultivation.

Situation in Holland: *W. H. R.* Advertise in these pages.

Terms of Service at the Royal Botanic Gardens, Kew: *J. J.* If you write to the Director, you will in due course be provided with the needed information.

Weight of Gros Maroc: *W. B.* We have no records of heavy bunches of this variety of Grape.

Wood-wool: *R. M. and S. T.* Scan our advertisement columns. We cannot, except in very special cases, recommend dealers.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

Important to Advertisers.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

Increased to the extent of 80 per cent., and that it is increasing weekly.

Advertisers are reminded that the "Chronicle" circulates among country gentlemen, and all classes of gardeners and garden-lovers *at home, that it has a specially large* foreign and colonial circulation, *and that it is preserved for reference in all the principal Libraries.*

THE IMPROVED GARDEN GULLY
(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—
8-in., 2*s.*; 10-in., 3*s.*; 12-in., 6*s.* 6*d.*
(*The larger sizes are very strong for Carriage Drives.*)

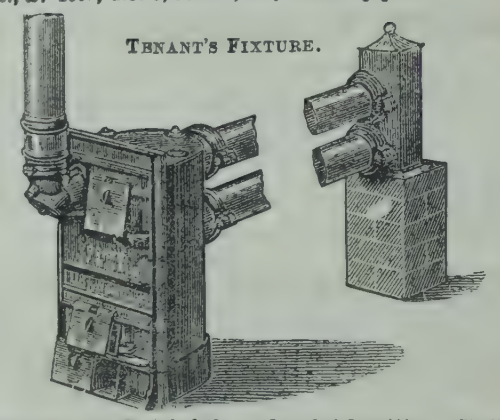
AMATEUR FORCING HOUSE.



The utility of this house for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance, it being a structure constantly in request, but almost hitherto unknown. See LIST, p. 22. Send for LIST, post-free.

"INVINCIBLE" HOT-WATER APPARATUS.

Most Efficient and Cheapest in Existence.

Made in six sizes: No. 1. to drive 75 ft., £1 15*s.*; No. 2, 100 ft., £3; No. 3, 200 ft., £4 10*s.*; No. 4, 275 ft., £7; No. 5, 375 ft., £7 15*s.*; No. 6, 500 ft., £9; of 4-in. pipes.

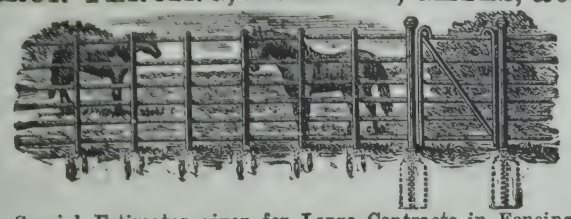
Requires no sunk stokehole, and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.

Cost of complete apparatus for Greenhouse with 4-in. pipes, flow and return along one side, cut and fitted; so that if the internal measurement of the Greenhouse is given, the apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all. Securely and carefully packed on rail at the following respective prices:—7 ft. by 5 ft., £2 15*s.*; 9 ft. by 6 ft., £3; 10 ft. by 7 ft., £3; 12 ft. by 8 ft., £3 5*s.*; 15 ft. by 10 ft., £4 5*s.*; 20 ft. by 10 ft., £5 5*s.*; 25 ft. by 10 ft., £6 5*s.* See page 186 in List.

COOPER'S HYGIENIC HEATER.

Burning Parafine or Gas without smoke or smell. These Heaters are constructed as a means of heating by Hot Air without the use of hot water or fires. Its peculiar construction economises the heat generated, so that there is no waste of heat or fuel. There being perfect combustion in this stove, and nothing whatever injurious to plants, but actually everything conducive to their health, it should be observed that plants may be had in full bloom throughout the severest winter. This cannot be obtained in stoves of other systems. The temperature can be regulated to a nicety to suit all requirements, being raised 15 degs. to 45 degs. above that of the outside. From 16*s.* complete. For full particulars, and prices of other sized Heaters, see ILLUSTRATED LIST, post-free on application.

THE RAPID PROPAGATOR.



The only perfect Propagator for raising Plants from seeds, slips, or cuttings:—

COWMAN.—Situation wanted on a gentleman's place. Life experience with stock; no family. No objection to help in Garden. Excellent character.—A. B., 4, Oxford Villas, Wormley, Broxbourne.

A GREAT BLESSING TO HUMANITY is without doubt a medicine composed of ingredients that, whilst it eradicates the germs of disease, strengthens the system. HOLLOWAY'S PILLS act in this manner, and in general debility, mental depression and nervous irritability there is no remedy which operates so beneficially. They purify the blood, give tone to the stomach, and thoroughly regenerate the system. They are mild in operation, although most powerful in removing disease. Delicate females and young children can take them with safety and benefit. It would be difficult to enumerate all the advantages to be derived by taking these wonderful pills. No household should be without them, for there is no complaint which they cannot cure or relieve,

Send for ILLUSTRATED LIST of

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

FOR RAISING WATER for the SUPPLY of TOWNS, VILLAGES, IRRIGATION, RAILWAY STATIONS, MANSIONS, FOUNTAINS, FARMS, &c.

No Cost for Motive Power, which is obtained from a Stream of Water passing through the Ram. No Oiling or Packing required. Made in sizes to raise from **300 to 300,000 gallons per day.** Will force to a height of 800 feet.

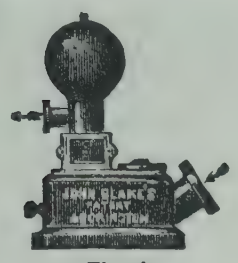

Fig. A.

This Ram raises a portion of the same water that works it.

This View represents Fig. A. Ram forcing up a part of the same water that works it, which is supplied from a spring. Special Rams of A. make can be supplied to force to a height of 800 feet.

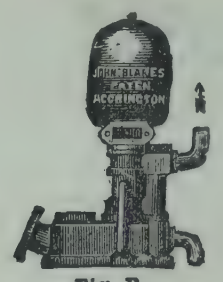

Fig. B.

This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

NOTICE TO ADVERTISERS.

In consequence of the alteration of the hour of going to Press, it is imperative that all Copy for Advertisements should be received BY FIRST POST THURSDAY MORNING at the latest.

Vegetables.

H. CANNELL AND SONS' COLLECTION of VEGETABLES, shown at the Royal Horticultural Society and at the Royal Aquarium last week, weighing above 2 tons, not only gained the highest award for quality and purity of strain, but was pronounced by the greatest authorities to be the best collection ever exhibited in England. Onions alone consisted of 34 distinct kinds, many weighing nearly 2 lb. each; and their size, ripe high colouring, and perfect finish—open field culture—contrasted clearly with others, proving absolutely that Kent produces the most perfect and certainly the best seeds. *Standard* says:—"Finest collections of vegetables ever seen."
SWANLEY, KENT.

The Best Present for a Gardener.

VINES AND VINE CULTURE.
The most complete and exhaustive Treatise on Grapes and their Culture ever published.
Third Edition just out.

SPECIAL QUOTATIONS TO LARGE BUYERS.

R. H. BATH, Osborne Farm, Wisbech.

GREAT SALE OF ORCHIDS.

JOHN COWAN & CO.

(LIMITED),

Have received instructions from

D. DE Y'BARRONDO, Esq., of ULLET ROAD, LIVERPOOL,

to sell his entire collection of Orchids for him, by private treaty, as he is relinquishing the cultivation of Orchids for the present. With this end in view, the collection has been removed to the Company's premises at Garston.

Mr. de Y'barrondo has for many years been known as an ardent collector of Orchids, and his collection is well-known in this neighbourhood, and indeed, throughout the country. The collection is in fine condition, and there are many fine specimens as well as numerous rare and fine varieties in each section.

The Company have also just purchased from the trustee of the estate of the late

E. G. WRIGLEY, Esq., of VICTORIA HOUSE,

Dukinfield, near Manchester, the collection formed by that gentleman. The principal feature of this collection is a choice lot of

HYBRID AND OTHER DENDROBIUMS.

Mr. Wrigley's collection was purchased and sold in this establishment nearly twelve months ago, but Mr. Wrigley immediately commenced to collect again and devoted his attention specially to Dendrobiums, bringing all his previous large experience to bear on securing only the choicest and best of each kind. The result is a most valuable collection of choice gems.

These two lots taken together will form one of the best collections which has ever been offered by the Company; and will be on view from TUESDAY the 23rd inst. CATALOGUES are being prepared, and will be posted to all the Company's patrons, and to any one who may send their name and address for that purpose, on FRIDAY, the 26th inst. All orders will be executed strictly in rotation, and no prices will be quoted or Catalogues shown to anyone before the date named; so that all purchasers may have an equal chance.

JOHN COWAN & CO.

(LIMITED),

THE VINEYARD and NURSERIES,

GARSTON, near LIVERPOOL.

POMONA FARM NURSERIES, WITHINGTON, HEREFORD.

NEW AND BEAUTIFUL HARDY SPIRÆA.

SPIRÆA ANTHONY WATERER.

This is a sport from the well-known Spiræa bumalda, from which it differs only in colour, the flowers being a rich crimson, borne in large corymbs thickly on the plant.
It is a continuous bloomer, and is without doubt the most important addition to hardy flowering plants of many years.
FIRST-CLASS CERTIFICATE,
Royal Horticultural Society of London.
Nice plants, 7s. 6d. each, will be distributed in November next.

ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey.

CUTBUSH'S MILL-TRACK MUSHROOM SPAWN.—Everyone can readily grow Mushrooms, and by using this Spawn will ensure success. All growers speak in high praise of the quality. Numerous Testimonials. None genuine unless in sealed packages, and *printed cultural directions* enclosed with our signature attached.
Price, 6s. per bushel, 1s. extra for package; or, 1s. per cake, free per Parcel Post.

NEW CARNATIONS { PERPETUAL OR WINTER-BLOOMING VARIETIES.
Certificated by the Royal Horticultural Society, also at the Crystal Palace, Bath, Exeter, &c.

MISS MARY GODFREY.
—Undoubtedly the finest white in existence. Blooms of good shape and good substance, 3 inches in diameter, of the purest white, freely produced, of robust habit, "non-bursting," and thoroughly perpetual.

REGINALD GODFREY.
—Has the same good qualities as the preceding variety, but is of a rich salmon-pink. Three times the size of Miss Joliffe, richer in colour, much more robust, and will produce *five* times the quantity of blooms. 5/- each.

These varieties have caused a great sensation wherever exhibited.

W. J. GODFREY, The Nurseries, Exmouth, Devon.

FRUIT TREES! FRUIT TREES!! FRUIT TREES!!!

This is one of our GREATEST SPECIALTIES, the soil and situation of our Nurseries being particularly adapted for Fruit Growing, and we Cultivate IMMENSE QUANTITIES of all the BEST and CHOICEST kinds in each class, including the LATEST NOVELTIES, worthless and inferior sorts being carefully weeded out. The trees are in the finest possible condition, thoroughly clean and free from blight, of robust constitution, and furnished with an abundance of fibrous roots—an important point which purchasers of Fruit Trees should not overlook, as well-rooted trees will give greater satisfaction than trees twice the size, but with stunted roots. Each kind is worked on the stock on which it flourishes best, and great care is taken to have all true to name.

APPLES, PEARS, PLUMS, CHERRIES
Standards and Pyramids, well developed trees, 18*s.*, 24*s.*, 30*s.*, 36*s.* and 42*s.* per dozen.
Two-year old Feathered trees of Apples and Pears, splendid quality, 15*s.* per dozen.
Dwarf and Horizontal-trained trees, for walls, espaliers, &c., 2*s.* 6*d.* to 5*s.* each.
Orchard House Trees, Pyramids, in pots, 3*s.* 6*d.* and 5*s.* each.

We can also supply a splendid lot of Pyramid Apples, trees that have borne fruit two and three years, of the following well-known kinds:—Astrachan Red, Annie Elizabeth, Betty Geeson, Blenheim Orange, Cox's Pomona, Cellini, Duchess of Oldenburg, Domino, Devonshire Quarrenden, Ecklinville Seedling, Grenadier, Keswick Codlin, Lord Derby, Lord Grosvenor, Lady Elizabeth de Tabley, Loddington's Seedling or Stone's Apple, Maltster, Northern Spy, New Northern Greening, Pott's Seedling, Plumbley Lass, Queen Caroline, Rose of Sharon, Ringer, Small's Admirable, and Old Hawthornden, all at 5*s.* each. Also a few extra-sized Pears at same price.

APRICOTS, PEACHES, NECTARINES
THE BEST VARIETIES.
Dwarf-trained trees, 5*s.* and 7*s.* 6*d.* each.

THE
Gardeners' Chronicle.
SATURDAY, OCTOBER 20, 1894.

JOHN HORSEFIELD.

LANCASHIRE has for the last hundred and fifty years been noted for its working botanists. They pursued the science partly as a quiet hobby, but more frequently as collectors, all their spare moments after the daily toil being devoted to flowers. In Horsefield's case, the love of flowers was clearly inherited, as his grandfather and father were botanists. The grandfather was born in 1732, and it is recorded of him that he was a good scholar and fond of botany, but fonder still of floriculture or the culture of florists' flowers. The father was born in 1764, and he was particularly fond of plants and flowers. John Horsefield was born on July 18, 1792.

The *Manchester Guardian* of March 2, 1850, contains the first chapter of his autobiography, and the only portion of it that was written. It gives the history of his boyish days. Horsefield had written it ten or twelve years before that date at the request of Mr. Wheeler of the *Manchester Chronicle*, but he never called for it. He afterwards sent it to the Editor of the *Manchester Guardian*, who had asked him to write some little account of himself. In his note he says:—"If by its means you can add another page or two to *The Short and Simple Annals of the Poor*, I shall be much gratified." The Editor wrote:—"His is evidently an hereditary passion for plants and flowers, both his father and grandfather occupying themselves in the study and culture of them." "Fair children of Nature's green kingdom." "He now lives at Whitefield, about a mile north of Prestwich, on the road to Bury, and within half a mile of the spot where he was born and brought up."

From this autobiography we learn that he was sent to school at six or seven years of age, so that he might learn to read before he was old enough to work. His tutor was a weaver, who had half-a-dozen scholars, who sat by his loom and read their lessons to him singly by his seat-board, while he continued his shuttle-driving. His terms were half-a-crown a quarter. Horsefield went to this school for twelve months, and thus learnt to read well. He then went to work at home, helping his father at his weaving. He was, at this early age, fond of books, and read everything that came in his way. The Bible was the first book he read through. He was then of a melancholy and rather fretful disposition, having a feeble and delicate constitution. Having learnt to read, he next went to a writing school, about a mile distant, held at 7 o'clock two or three nights a week. This he continued through the winter of 1805. Subsequently he went to another evening school for one or two

*

years, the charge being a penny a night, and thus he learned arithmetic. This completed his education. He never learnt grammar! He very soon took to botany. Culpeper's *Herbal* was his first book, and he remarks, "I think Culpeper's romantic accounts of the virtues of the plants affected the youthful imagination much in the same manner as a story of giants or other extraordinary characters; at least, it had nearly the same effect upon me, but with this difference, that the plants spoken of I hoped some day to have the opportunity of seeing, whereas in the case of giants, &c., such a hope would be quite improbable. With this the autobiography ends. Horsefield settled down at Whitefield, about 4 miles north of Manchester, as a weaver, where he lived all his life.

The next description of him, as a botanist, we find recorded by the veteran Richard Buxton, in the introduction to his *Botanical Guide to the Flowering Plants found indigenous within* 16 *miles of Manchester*, published 1849. He says, "One day in the month of June, 1826, I went to Kersal Moor, and was quietly engaged in botanising when I happened to see a person engaged in the same pursuit as myself . . . We walked together on the Moor talking on botany, and observing the different plants as we went along. I found him just the man I had long wished to meet with; not a mere country herbalist, but an excellent scientific botanist. This was no other person than John Horsefield, hand-loom weaver of Whitefield, the President of Prestwich Botanical Society, and now the President of the General Botanical Meetings held at different places in the county, a profound botanist, and well-read man; worthy to be the successor of Edward Hobson, the last President of the Society. Thus at the early age of thirty-four we find Horsefield able to fill this post; which would tax the skill of our most accomplished botanists. At these meetings all the working botanists of Lancashire and Cheshire attended, the object being 'the specific determination and accurate nomenclature of the plants which were produced.' The Chairman had to take up each plant and give first its Latin and then its English name, and to add remarks on its occurrence, &c." There were in those days usually a hundred persons present, and at the annual meetings there were sometimes two hundred present. About thirty such meetings were held during the year, the place of meeting circulating through the neighbouring villages. In this way a keen interest was kept up, and the botanical students had great opportunities of becoming acquainted with scientific botany.

Mr. Leo Grindon recollects John Horsefield from the year 1839, when he would be approaching his fiftieth year. He says he was accustomed to meet that glorious old man in his home at Besses-o'-th'-barn —or Whitefield—where he had a trim little cottage, the hand-looms occupying one of the principal rooms. The house was neat, not large, and had a well-stocked garden in front, and nearly surrounding it. In this garden he cultivated very many rare and curious plants, amongst which he remembers seeing Ramondia pyrenaica, and Veronica sexatilis, with many other rare Alpines. He also grew "florist-flowers," "basiers" (or Auriculas), "polyants," Tulips, &c. The cultivation of florists' flowers and hardy plants was then a favourite pastime with naturalists of his class. They helped one another, and whenever a man went a long journey into the country or further away to the Welsh, Derbyshire, or Cambrian mountains, his object was to obtain something new for their botanical collections. Mr. Grindon describes with delight his remembrance of forming one in a little party led by Horsefield through Mere Clough to Fo' Edge, the mountainous ridge beyond Bury. Horsefield was then a spare thin man, exceedingly quiet in his demeanour, no hilarity, but a calm sweet-tempered dignity that recommended him to everyone who came into company with him. Always full of information, good nature, and gentleness; never seen out of temper, placid, friendly, generous.

In addition to his skill as a gardener, Horsefield, like many other Lancashire florists, understood the method by which flowers are improved, by fertilizing one variety with the pollen from another. It is on record that he raised a new Tigridia conchiflora var. Watkinsonii, which was so good a flower that it was sold to Mr. Watkinson, a nurseryman, for £10. It is figured in *Paxton's Botanical Magazine*, and was obtained by cross fertilization, with the pollen of T. pavonia. Whether or not he pursued a similar method with Daffodils is a question which has attracted much discussion in Lancashire. It was stated at the Narcissus conference of 1884, that Narcissus bicolor Horsefieldii was a chance seedling from N. bicolor. It was, however, stated to the writer by the late E. K. Norris, of Northenden, who lived near Horsefield in his youth, and was well acquainted with him and his garden, that he raised this grand flower by crossing the old N. bicolor with pollen from a very fine flower of N. pseudo-Narciss.

It is well known also that Horsefield watched with hopeful interest, the fine seed-pod which were ripening in his garden, and watched with the greatest interest the result when the seed had been harvested and sown. Mr. Percival also states that in this batch of seedlings there were two other good varieties, which are still in existence, one of which is almost the same as N. princeps. It is therefore exceedingly likely that Horsefieldii was not merely obtained by chance. It remains amongst us, a fitting memorial of John Horsefield, and is worthily called "The King of Daffodils."

It was a famous flower in his lifetime. The whole stock remained in his possession until 1854, and the bulbs were not dispersed until after his death in that year, when they were sold for the benefit of his widow. There were then twenty-eight blooming or full-sized bulbs, and nine small ones. The sale or "letting-out" was attended by many florists, for the fame of Horsefield's Daffodil had spread far and wide. An enthusiastic florist offered a copper kettle to be competed for the year following, the prize to be awarded for the best flower of N. Horsefieldii. A show was accordingly held in the spring of 1855, when the prize fell to Joseph Allen, the landlord of the "Eagle and Child" at Whitefield, where the Botanical Society's meetings were held. It is interesting to note that twenty-three varieties of Narcissus were exhibited on that occasion. Horsefield died on March 6, 1854, in the sixty-second year of his age. The following tribute to his memory was written by Charles Swain, a Lancashire poet, and is copied from a neatly-framed card in the room

Fig. 59.—Beurré Fonqueray, bush or pyramid: grown in the open air.
(see p. 467.)

where the Botanical Society, of which he was so long president, held its meetings.

In memory of
JOHN HORSEFIELD
OF WHITFIELD, BOTANIST,
Who died on March 6, 1854, in the 62nd year of his age.

Ye who behold God's work, in Nature's ways,
And find in flowers, mute anthems to his praise;
Who read the volume of eternal love,
In seeds of earth, as in the stars above;

Fig. 60.—BEURRÉ HARDY, A PYRAMID: GROWN IN THE OPEN AIR.

Here read a name whose fame shall long endure!
One poor by birth, but gifted, although poor!
God, unlike man,—the humblest spirit lifts,
Nor asks his wealth, before he sends his gifts.
Where'er botanic science could be learn'd—
New links disclosed—new species yet discern'd:
Where'er by wood, or lane, or heath, or hill,
God ope'd the book that taught botanic skill,—
There Horsefield's foot from dawn to eve was seen,
To learn; to teach; to be, what he has been:
An honour to the soil that gave him birth;
A mind of truth—a heart instruct with worth.
Oh, may the spirit for whose loss we grieve,
Our God accept,—Our Saviour Lord receive

Wm. Brockbank, Brockhurst, Didsbury.

New or Noteworthy Plants.

CALATHEA POLYTRICHA, *Baker, n. sp.**

This fine new Scitamineous plant belongs to the group of Calatheas in which the flowers form a sessile tuft in the centre of the rosette of leaves. Its nearest ally is C. flavescens, *Lind. Bot. Reg.*, t. 932 (Phrynium grandiflorum, Roscoe), from which it may be distinguished at a glance by the very hairy leaves and bracts. It is a native of the island of Trinidad. We have a dried specimen in the Kew herbarium, collected in 1868 by Prestoe on the banks of the Caroni river It was sent lately to Kew in a living state from the Trinidad botanic garden, and has flowered this autumn. It is remarkable for its globose tubers and ornamental flowers, but the leaves are not in any way striped or spotted, as they are in so many of the species of Calathea and Maranta, prized by cultivators. It would be worth trying what is the quality of the farina which the tubers yield.

Acaulescent. Root-fibres slender, bearing globose tubers as large as a small Potato. Produced leaves about four in a tuft, erect; petiole 5 to 6 inches long, winged on the edges, densely clothed with spreading hairs, blade oblong acute, 6 to 9 inches long, hairy on both sides, plain green above, much paler beneath. Flowers many in a rosette, which is sessile in the centre of the tuft of leaves; bracts multifarious, acute, oblong, very hairy, 1 to 1½ inch long; calyx cylindrical, white, membranous, lobes linear; corolla-tube white, cylindrical, longer than the calyx, lobes lanceolate, erecto-patent 1 inch long. staminodia obovate, emarginate, lemon-yellow, rather longer than the corolla-lobes; style half as long as the corolla-lobes. *J. G. Baker.*

* *Calathea polytricha*, Baker, n. sp.—Acaulis, fibris radicalibus tuberis globosis præditis; foliis 3—4-nis erectis oblongis acutis viridibus concoloribus utrinque pilosis; petiolo elongato canaliculato hirsuto; floribus pluribus in rosulam centralem sessilem aggregatis; bracteis multifariis oblongis dense pilosis; calyce cylindrato albo membranaceo, segmentis linearibus; corollæ tubo cylindrato calyce longiori, lobis lanceolatis staminodiis obovatis emarginatis citrinis calycis lobis paulo longioribus; stylo staminodiis valde breviori.

POLYPODIUM (EUPOLYPODIUM) DENDRICOLUM, *Jenm., n. sp.*

Rootstock slender, erect, fibrous; stipites 1 to 2 lines long, densely tufted, wiry, erect, brown, clothed freely with dark chestnut spreading hairs; fronds erect, linear, simple, 2 to 5 inches long, 2 lines wide, strict, coriaceous, dark brown-green, under-side paler, both surfaces hairy, margins uniformly scalloped above the narrowed base; rachis on both sides covered by the parenchyma; veins consisting of three spreading branches in each scallop, the interior fore-shortened, and fertile at the apex; sori one to each lobule, alternate, round, medial, apart, superficial, receptacles embossed, dark, oblong. Jamaica, on trees at and above 5000 feet altitude in the Port Royal Mountains. Communicated by Mr. Hart. Nearest to the local P. Fawcettii, Baker, but differing by its stiff texture, scalloped margins, and three-branched spreading veins. *G. S. Jenman, Demerara.*

PEARS AS PYRAMIDS.

Referring to our notice of Messrs. J. Veitch & Son's fruit nurseries at Langley, which appeared in our issue for September 29, p. 367, we are now enabled to afford our readers illustrations of young trees in bearing, as they appeared this season. The varieties are the large, handsome, hardy, very free-bearing new Pear, Beurré de Fonqueray, growing on the Quince; and an old favourite Pear, Beurré Hardy, also large, handsome, and richly-flavoured, and very good eating when grown on warm soils. The illustrations (fig. 59, p. 466; fig. 60, p. 467) show, if any further proof be needed, the desirability of planting in small and amateurs' gardens this easily-managed form of Pear tree, especially as the older system of constant summer pinching has fallen into deserved disrepute. As regards the freedom to fruit, the specimens speak for themselves.

Orchid Notes and Gleanings.

HABENARIAS AT BURFORD.

These beautiful flowers, of which Sir Trevor Lawrence was one of the first successful cultivators, have for a long time past made a good display in the warm house at Burford, in which Vanda teres so admirably thrives, and in which a strong plant of Vanda × Miss Joachim (Hookeriana × teres) bids fair to be the first to flower in Great Britain. The front stage of the house is filled with plants of the bright cinnabar-scarlet-flowered Habenaria militaris, and not one of the plants has missed flowering. Arranged with these are a smaller number of Habenaria carnea and H. c. nivosa, furnished with pure white or flesh-coloured large and wax-like flowers, which seem almost out of proportion to the small plants that bear them. All of these species have beautifully and diversely marked foliage, which in itself would render the plants objects worthy of cultivation. When the flowering season is passed, and the foliage withered, the plants are put on a shelf in a temperate house, where they remain for the winter; and it is this season, as Mr. W. H. White, the Orchid-grower

at Burford, told me, which is the most critical, for, although they are put away to dry off and pass an inactive season, they must receive a little water at intervals of a week or so, in order to prevent the slender tubers from becoming too much shrunken to allow of their starting strongly into growth when repotted in the spring.

Stenia pallida.

This pretty and rare species is now in flower in Sir Trevor Lawrence's garden, Burford Lodge, Dorking. Its flowers, which are produced singly, are in size and general appearance like those of Odontoglossum Pescatorei. In colour, they are pure yellow. The thickened form of the base of the labellum, like the hypochile of a Stanhopea, and its small front lobe, serve well to distinguish it from the allied Chondrorhyncha, to which it has some resemblance in its habit of growth. It is a very neat-looking plant, and is apparently very floriferous. *J. O'Brien.*

Schlimia trifida.

This is one of the prettiest, rarest, and most fragrant of small-growing Orchids, and since it was first exhibited by Sir Trevor Lawrence, Bart., at the Royal Horticultural Society in 1877, it has been seldom seen. It is again in flower in the Burford collection, where its delightful fragrance fills the house in which it is suspended. It bears a drooping raceme of several wax-like white flowers, with a few purple spots. The flowers are about 2 inches in length, and of very peculiar structure. It was illustrated in the *Gardeners' Chronicle*, vii. (1877), p. 141.

Plant Notes.

MISS MELLISH SUNFLOWER, ETC.

This very fine form, so very kindly distributed by the Rev. Mr. Wilks, I saw growing largely in the hardy plant grounds of Mr. B. Ladhams, Shirley, Southampton. It is of good average height, flowers large, yet not at all unduly so, having each a double row of ray-florets, that are of a bright yellow colour, pointed, and partially incurved, so that of all hardy flowers it is, perhaps, the nearest imitator of the popular Cactus Dahlia that we have. So striking and beautiful are the flowers, that the variety takes almost the highest position in the genus. A very interesting and effective member is Helenium grandiflorum spicatum, height 4 feet, flowers medium size, with an orange base, and deeply flushed and striped with red. This blooms late, is very free, and a charming variety. *A. D.*

Ampelopsis Veitchi purpurea.

This is a remarkably handsome creeper, suitable for a wall; it looks well as a companion to other wall plants, or as a single specimen; it is quite hardy, and not at all fastidious as to soil or situation, except that it does not do so well in a northern aspect. I prefer it to Ampelopsis Veitchi, which is a good thing in its way, and suitable for covering a space on a low wall facing south; but Ampelopsis Veitchi purpurea is a striking object at this season of the year, and is remarkable for its lovely shades of colours, and, above all, it retains its leaves a longer period than most of the species, and the leaves and growths can be utilised for dinner-table and room decorations.

THE SEED TRADE.

(*Continued from p.* 368.)

It will be gathered from these elaborate tables that the importation into this country of Clover and Grass seeds is one of the most prominent branches of the industry, amounting as it did to the enormous value of £792,061 during 1893, and as it may be of some interest to many readers, we now give the names of the ports at which these seeds were received to get an idea as to the channels from which they would be ultimately distributed:—

London (*viâ* Thames), 117,944 cwt.; Liverpool, *19,355; Bristol, *2 352; Dover, 604; Folkestone, 145; Goole, 624; Grimsby, *2,269; Hartlepool, 947; Harwich, *24 665; Hull, *51 694; Newcastle, 481; Newhaven, *18,362; Plymouth, 418; Southampton, *22 087; Leith, *29 986; Aberdeen, 700; Dundee, 170; Glasgow, *27,201; Grangemouth, 2,261; Greenock, 120; Dublin, 2,887; Belfast, 5,290; Cork, 97.

It should be borne in mind that these figures represent seeds brought into the country, and they must not be confounded with our own productions, of which the following table gives some information:—

Crops.	England.	Wales.	Scotland.	Ireland.	Isle of Man.	Channel Islands.
	Acres.	Acres.	Acres	Acres.	Ac.	Ac.
Beans	229 342	1,637	13,975	3,280	...‡	...‡
Peas	208,17	1,266	1,042	326	...	...
Turnips and Swedes ..	1424,093	71,387	479,755	302,820	...	...
Mangel	338,543	7,484	982	47,025	...	...
Cabbage, Kohl Rabi, Rape ...	146,11[illegible]	1,819	8,267	46,897	...	...
Tares	161,314	2,058	12,120	5,358	...	...
Clover and Grass (rotation crops)† ...	2675,271	317,835	1576,524	1300,168	...	...
Lucerne... ...	17,617	311	27	...‡	...	373
Carrots	10,734	347	891	...	77	200
Beetroot... ...	2,200	53	29	...	4	82
Sugar-Beet ...	88	...	5	...	1	62
Other crops, including Parsnips, Onions, Spinach, Rhubarb, Radish, Broccoli, Cauliflowers, and the minor products of market gardens not separately recorded ...	70,981	538	1,326	...	36	770

Unfortunately, the Returns of the Home-grown crops, as issued by the Board of Agriculture for 1893, do not give a deal of information from a seedsman's point of view; there are, however, some particulars that will be of service from the fact that every acre sown requires seed to sow it, and this has to be supplied from one source or another. We are unable to define what portion of the area under cultivation was utilised for purposes other than the production of seed, and it would in many instances be somewhat difficult for the Government to collect such particulars without an alteration in the methods adopted at present, hence we give the areas as recorded of each crop grown in the United Kingdom, irrespective of the purpose for which it was required, in many cases probably undetermined until the crop was well forward.

Imports of Bulbs, Plants, Shrubs, and Trees in 1893.

From Holland, value...	£153,889§
From Belgium ,, ...	36,006
From France ,, ...	44,957
From Japan ,, ...	9,825‖
Exports.	
To the United States, value	£7,609
To other foreign countries ,, ...	5,185
To British Possessions ,, ...	2,685

Seedsman.

* A large portion of these landings would ultimately come to London, others would be offered by sample on Mark Lane.

† A large portion of these acreages is down for one to four years, so that seeds would only be required once during this period. As regards Permanent Pasture, it appears there were 233,000 acres more than in 1892; but it would be imprudent to say this was the area sown out during 1893, because there are no records of worn-out pastures that may have been broken up.

‡ Separate returns do not appear to have been made here.

§ These would mostly comprise Dutch bulbs.

‖ These would mostly be Lilies.

GREENHOUSE FLOWERS AT BURFORD LODGE.

The greenhouse near the Orchid-houses in Sir Trevor Lawrence's gardens at Burford is always a very interesting and pretty sight. In it not only are the stages furnished with the best examples of the flowering plants suitable for a cold house, but provision is made for the roof to give a great aid in the general effect by means of trailing plants and plants in suspended baskets. At various times we have seen, suspended in the greenhouse at Burford, specimens of the elegant Lotus peliorhynchus, Fuchsia procumbens, the species of Asparagus, and other plants not usually seen to such perfection. At present the profusion of flowers on the white and the red Lapagerias, and some very handsome baskets of tuberous Begonias, give the chief display overhead, while the fine specimens of all colours of tuberous Begonias, scarlet Nerines, &c., make a great show arranged with foliage plants on the staging. Some interesting and beautiful uncommon greenhouse plants too, are in flower, one of the prettiest being a specimen of Trichinium Manglesii with ten large, silky heads of its pretty white and pink flowers. The large-flowered tuberous Begonias suspended overhead, which Mr. Bain allows to droop around without trimming, illustrate a mode of using these showy plants, which should be carried out to a much greater extent than it is, for so grown they are even more beautiful than when staked, as they must necessarily be for growing on the stages. Of course, only a limited number can be suspended, but it gives an additional and very effective use for the plants. *J. O'Brien.*

A TRAVELLERS' NOTES.

(*Continued from p.* 436.)

Sydney Botanic Garden.—The Palace garden, the old exhibition grounds of 1879, are prettily laid out; there are numerous beds and shrubberies, some statuary, and many single specimens are dotted about on the rich Buffalo lawn. Seats are in all available spots, and the many visitors testify to the appreciation in which the gardens are held. The plants are chiefly those found in the older section; being much younger, they are naturally of less size.

Near the palmetum is a specimen of the N. S. W. Birch (?), a pretty, compact tree. Sydney is somewhat too warm, it being only seen at its best at higher elevations. Palms are largely represented. In addition to the palmetum, many specimens are scattered about on the wide lawns, where, in addition to every advantage for complete development, they can be better studied. In the palmetum proper, a Jubæa spectabilis is one of the most noticeable, though, in point of size, another specimen elsewhere eclipses it; 25 feet high, its funnel-like stem is 3½ feet in diameter at 4 feet from the ground, the small head of foliage affording a vivid contrast to the gigantic leaves of Arenga saccharifera close by. Sabal umbraculifera is very fine, 6 feet being the usual breadth of its magnificent leaves; its stem apparently decreases in diameter with advancing age. Near a much-ramified 24-headed Dracæna Draco is a good Phœnix reclinata, its thin stems and long foliage soaring some 20 feet, the nakedness at the base well filled in with oncoming shoots. An 80-feet seeding Cocos plumosus needs but mentioning. Mr. Harwood thinks highly of Kentia Lindeni; its claret-red young leaves are in themselves of value for horticultural purposes, to say nothing of the older foliage, often 8 to 10 feet in length, springing at almost right angles from the strong ligneous stem; they are clothed with pinnæ their whole length. Sabal princeps is good, presenting a series of sharp diagonal lines from the split bases of dead leaves adhering to the trunk; it is now flowering freely, producing creamy-yellow panicles, 3 to 4 feet long. Seaforthia elegans, 35 feet in height, with a round, even head, and Chamærops excelsa, C. Fortunei, are both good.

Pritchardia Martii, from the Hawaiian group, is pretty. The young leaves are clothed with the softest down; whilst amongst other noticeable Palms are Areca madagascariensis, 35 feet in height, with a bunch of light graceful stems, and neat short pendulous leaves; Phœnix paludosa, a rugged, unkempt mass of short 18-inch foliage; and Copernicia cerifera, the Cornauba Palm of Brazil, noticeable for its tall slender fibre-hidden stems, broad, stiff, fan-like foliage and its productiveness of offshoots.

The Palace grounds are not without their quota of the Palm family. Kentia insignis is here well represented. Its stiff, distinct leaves, silvery beneath, and often 12 feet in length, crown a fibre-covered stem. Close by a small stem of Livistona

Hoogendorpi, from Java, promises well, and a fruiting Kentia Forsteriana is interesting. In another portion of the garden, on either side of a creek, and but a few yards apart, are two good fruiting examples of the two leading Kentias (from a nurseryman's view) of Lord Howe's Island. I naturally refer to K. Forsteriana and K. Belmoreana, two species widely distinct in habit and mode of fruiting. The foliage of the former rises straight and stiff, and is unbending to lighter breezes, with the lower pinnæ flat; whilst those of the latter are recumbent and graceful, the lower pinnæ of each leaf being erect.

In K Forsteriana the spikes in the axils of the leaves vary from three to nine united at the base; in K. Belmoreana they are invariably separate. In both the male flowers crown the end of the spike, the females producing fruit on the lower portion. The spikes of K. Belmoreana are by far the longer, often reaching 3 to 4 feet. The seeds are very similar, probably accounting for the harvesting of the two species as one. Into the details of this most interesting comparison Mr. Moore was good enough to fully enter and clearly explain, with the aid of several available living examples. Phœnix farinifera is represented by a gaunt specimen, with three slim, 30 feet, absolutely bare stems, and narrow foliaged graceful heads.

In the lower garden are also some good single specimens worthy of note. Sabal Blackburniana, a perfect piece of Livistona Mauritiana, a tangled impregnable mass of Phœnix rupicola, some 12 feet high and 15 feet in diameter, not a vestige of a stem to be seen; Phœnix leonensis, probably the strongest grower of the genus; Phœnix dactylifera, the spread of branches considerably greater than the height—a perfect specimen doubtless, partially owing to its isolation; and Phœnix reclinata, covering a diameter of over 30 feet, are amongst the most striking.

In the palmetum may also be seen the only Australian Calamus, C. Muelleri, Cycas circinalis doing better than C. revoluta, to which a moist season is essential. Strelitzia Augusta, one stem rising to nearly 40 feet, the whole at first sight deceivingly resembling a Ravenala, &c.

One of the most interesting genera in the garden is Agathis (Dammara). One species, by many considered the handsomest, bears Mr. Moore's name, owing its introduction to science to his explorations in New Caledonia. D. robusta, found as far north as Cairns in Queensland, is probably the best known, and certainly the one most frequently met with under cultivation. One specimen is 100 feet high; its tall straight stem and tapering head render it easily distinguishable from the remainder of the species in the garden, which are, in general appearance, somewhat similar. D. ovata and D. obtusa are both decorative, the latter producing the largest foliage of the genus. D. vitiensis, from the Fiji Islands, and D. orientalis are not dissimilar in general aspect. D. spinulosa and D. pumila are, however, distinct from all, the former by its slender, irregular habit, the latter for its obovate foliage and diminutive size, owing to exceeding slow growth; both inhabit the neighbouring French colony. The only other species I would mention is the New Zealand D. australis. The higher temperature of New South Wales prevents its doing very well, the one in the garden now being but 2½ feet, though specimens have attained 14 feet.

Araucarias are numerously represented, the Norfolk Island species being amongst the finest trees in the garden, and certainly the finest I have seen anywhere, a grand specimen, 118 feet in height, leading the way, the stems averaging 4 to 5 feet in diameter. This Conifer is handsome at this height, clothed with branches to within a few feet of the ground, and not denuded, as is A. Bidwilli so frequently under cultivation; that species, though represented in the garden, is scarcely at home. A. Cookei reaches 45 feet, though its varieties and forms as here represented are preferable for ornamental purposes; A. C. pendula (named by Mr. Moore), of general similar aspect, has a larger leaf than the type; a small 2-feet specimen of A. C. Rulei produces shorter, more acuminate foliage, of a paler tint; and rigida by its name denotes its distinctive feature. A. Rulei, in like manner, in addition to the normal form, here very fine, though not large, offers varieties. A. Rulei Balansæ, from New Caledonia, has longer, slenderer branches, more thickly clothed with shorter, sharper leaves, of a richer green—a certain horticultural improvement on the type. A. Cunninghamii and A. elegans, the latter rather disappointing, are also to be seen.

The trees of Japan do well in some instances, though Mr. Moore tells me the Fir family and many deciduous trees, including the Maples, fail. I also note an absence of those from the higher elevations and the north. Aralia spinosa is good. Chimonanthus fragrans is represented by a bush 8 feet high, and grows with great rapidity. Torreya nucifera, Olea ilicifolia, Illicium religiosum, Quercus glauca, Clerodendron trichotomum, Eriobotrya, 30 feet high and 20 feet through—a magnificent bush; Ilex latifolia, and Hovenia dulcis, 35 feet in height, are amongst the most noticeable. *James H. Veitch.*

(To be continued.)

Fig. 61.—Fruit of pear Beurré Hardy. (see p. 467.)

FUNGUS HUNTING IN 1894.

Fungus hunting for the past four or five years has been of such a nature that the writer of this notice felt no great anxiety to risk the contingency of damp feet and a cold by prowling through wet woods and dank grass in search of "toadstools." Submitting to pressure on the afternoon of Saturday, October 6, he met two or three daring friends at Orpington Station, and together strolled to Chislehurst, under the impression that they represented the West Kent Society on their annual fungus foray. It is matter of meteorological history that it rained all the afternoon, as it often does when a fungus hunt is planned, and only a very few excursionists ventured abroad. We passed over nearly the same ground as last year, and although diligent search was impossible, yet it was soon evident that the fungus crop was better than it had been for two or three years, although nothing of great rarity or importance was found, except a cluster of white Agarics, of the same species as a similar clump, first found during a rainy afternoon, in October, 1883, at Lyndhurst, and never seen since. This was named Agaricus (Clitocybe) pergameneus (Cooke), and described in *Grevillea*, eleven years ago. It is always of interest to corroborate a new species by finding additional specimens in a distant locality, and we were satisfied with our stroll, not only because of a more liberal supply of fungi to collect, but also because one of the number was a species, which, as far as we are aware, had only been met with once previously.

On the following Saturday afternoon (October 13) we joined the members of the Essex Field Club to undertake their annual foray in Epping Forest Fortunately it did not rain until the evening, and the hunt was prosecuted with vigour and high spirits. Fungi were undoubtedly far more numerous than they have been in that locality for four or five years, so that within the space of less than three hours a list was compiled of some 110 different species which had been seen or collected. Nothing new, rare, or remarkable was recognised, but seven species were added to the list of the fungi of Epping Forest, including Agaricus (Mycena) rosellus, a pretty little rose-coloured species; Agaricus (Psathyrella) subatratus, Batsch; Bolbitius fragilis (Fries.); an edible species, Cortinarius castaneus (Fries.); Hygrophorus niveus, a white species, by no means uncommon, but which has not been recorded for Essex; Lactarius pubescens (Fries.), and Merulius pallens (Berk.). All these came from around High Beech. There was a fair attendance of members, but not so many as on some previous occasions. The locality selected was that of High Beech, and something could be seen in any direction to which the foragers betook themselves, until it was too dim to see anything smaller than one's fist. As usual the interest was chiefly in the direction of something to eat, and all enquiries were of a utilitarian character. The tables at the meeting place were adorned with the spoils of the day, and notably, large piles of Craterellus cornucopioides, since this species is becoming popular, as an esculent, with the members of the club. This was evident at the close of the meeting, when all the Craterellus had disappeared. One lady was very much concerned to hear that the splendid crimson-and-gold Agaricus muscarius was poisonous. She thought it was so beautiful, that it must be a great mistake to say it was not good to eat, whilst she considered that the dirty-looking black 'Horn of Plenty" did not look fit for the pigs.

During the evening meeting a rather lengthy paper by Dr. M. C. Cooke was read, entitled "Some Confessions of a Fungus-eater." Looking over the collections spread over the tables for exhibition, it was noteworthy how some species preponderated, and that so many which are usually common species were absent. There was, for instance, Lactarius turpis everywhere, within and without. Scarcely any species of the large sub-genus Tricholoma, and, except Agaricus infundibuliformis and Agaricus ditopus, scarcely any of the

sub-genus Clitocybe. Not more than half-a-dozen specimens of the very common Agaricus melleus were in evidence; plenty of Lactarius and Russula, but only a solitary Cantharellus cibarius, and less than half-a-dozen specimens of Hygrophorus. During the day not a single Cantharellus aurantiacus could be found, although sought diligently, and in some seasons very abundant. From other localities we have learned that the crop of Hymenomycetal fungi has been moderately good, and more like what they were some six or seven years ago. *M. C. C.*

RE-AFFORESTMENT OF PARTS OF WALES.

I observe that a Government official has been requested to report on the suitability of the Crown lands in South Wales for planting purposes. This is a step in the right direction, and it is to be hoped that a large scheme of re-afforestation will be the result of his investigations. Already an attempt has been made to throw cold water on the scheme by a writer in the *Times*, who cites his own case as as example of what may be anticipated should the project be carried out. I do not doubt what this gentleman says with regard to the failure of the Larch on the estate with which he is connected, but he is evidently unaware of the fact that there are other forest trees which, so far, have not yet failed to thrive on our mountain sides, and which in many localities are fairly remunerative to those who plant them.

The failure of the Larch in different parts of Wales is beyond dispute, but this result has been brought about in many instances by the indiscriminate selection of the ground in which they have been planted. A short time ago I had occasion to examine several young Larch plantations of considerable extent in Wales, which present the most glaring spectacle of incompetency or want of judgment I have ever seen. The greater part of the land which these plantations occupy is of the poorest description, wet, and utterly unfit for the cultivation of the Larch, in fact, some of it is so bad that no tree with which I am acquainted would live, much less thrive upon it, for any length of time.

Another frequent cause of failure is planting two crops of Larch in succession on the same land. In ninety cases out of a hundred the trees in such places will either die right off when very young or prematurely mature. I know only one place in the British Isles where this experiment has been attended with success, and where the second crop equalled if not surpassed the first.

Other causes, more or less of a preventable nature, besides those alluded to, have helped to bring about the decline of the Larch in this country, which I need not refer to now, but with your permission I may do so on a future occasion. I should like to mention, however, one of the reasons or causes lately given by an authority of some repute regarding the failure of the Larch in Wales. This gentleman stated that Larch could not thrive in Wales on account of the humidity of its climate. So far as my experience goes, this statement has no basis whatever to rest upon when viewed from the light of every-day experience. Take Ireland, for example, where the rainfall is excessive; there the Larch will be found thriving better and freer from disease than in any part of England, Scotland, or Wales.

Granting, however, that the Larch is a precarious tree to plant exclusively, I maintain that remunerative plantations can be formed in many districts in South Wales. I do not know a district in Great Britain where a better demand exists for a certain class of timber, nor where greater advantages exist for the supplying of it, and which have been less availed of, than the district referred to. The supplies of timber from local sources are very small compared with those that come from other and more distant places.

If anyone doubts this, let him take a walk along the docks at Cardiff and Newport as I have done, and he will find that the greater part of the timber required in South Wales for pit purposes comes from France.

This in my opinion is a national disgrace. There are thousands of acres in South Wales, which at present are returning little or nothing to the proprietors, but which if judiciously planted would in time become the most valuable portions of their property.

The advantages to the district in carrying out a scheme of this kind would also, I need scarcely say, be inestimable. I therefore again express the hope that something will be done to remedy a state of things the neglect of which has greatly benefited our Continental neighbours. *David Robertson, Chester.*

The Week's Work.

THE FLOWER GARDEN.

By John Lambert, *Gardener, Powis Castle, Welshpool.*

THE FLOWER BEDS.—If frosts have spoilt the bedding plants, or they are become unsightly, the beds of them should be cleared, reserving the best of anything that it may be desirable to keep over the winter for propagation purposes. The potting up of plants for this purpose will be advisable even should the weather not be severe. The plants should be cuttings of 1893, or, failing these, of last spring, except in the case of new kinds and varieties, of which the stock may be scanty. At this late part of the year, bedding plants when taken up for saving them, pass the winter best in small pots, one or two being placed in a pot. Before potting them remove the longer shoots and all decaying leaves, leaving the shorter shoots to carry on the growth of the plant, and cut off the longest of the roots. For potting a light porous soil is best, and the potting should be firm. They will keep in health in any light, dry house, from which the frost can be excluded by fire-heat. If space be a matter of moment, cut the plants hard back, the tops thus cut off being dipped in fresh lime or charcoal-dust, and packed close together in sandy loam in well-drained pans or cutting boxes.

HYACINTHS AND TULIPS, ETC.—As soon as the beds are cleared of the summer bedders, dress them with manure, if the soil needs enrichment, and double dig the ground if it be of good depth, breaking the clods. Let it lay untouched for a day or two, that is, till the surface loses its stickiness, and then roughly level, and make it firm by raking and treading it, afterwards raking it level. For a planting tool use a dibber with a rounded end, not a pointed one, of the desired size. This will do very well for Crocus, Scillas, Tulips, and other small subjects which go into holes of 3 or 4 inches in depth. Hyacinths, Lilies, Narcissus, Crown Imperials, &c., should be planted with the trowel. Hyacinths may be 5 to 6 inches deep, and these and Tulips may be planted from 4 to 8 inches apart accordingly as they are of themselves intended to cover the soil or are used in conjunction with other plants. If the soil holds much moisture during the winter, throw it out to a depth of 2½ feet, and place a layer of drainage material in the bottom of a thickness of 9 inches, and put rough coal-ashes over this, then replace the soil, and beneath each bulb place a pinch of silver sand.

SPRING FLOWERS OTHER THAN BULBS.—Polyanthus, Wallflowers, Aubrietias, double-flowered Daisies, Auriculas, Violas, &c., should be planted; and if these occupy the beds with the bulbs, the latter should be put out when these plants are in their places. A too rich soil does not suit this section, as their foliage is apt to be made at the expense of flowers, and as much care is necessary in planting them as is usually bestowed on the summer bedders.

RANUNCULUS AND ANEMONES.—Now is a good time to plant some of these, the fine varieties of which make attractive beds. The soil of the beds should be well prepared, and the corms planted about 2 inches deep, and 5 inches apart. The more expeditious way of planting them is, after digging the ground, and treading it regularly all over, to throw out the soil to the required depth, place the corms in position, and return the soil, making it level. The beds should be on a slight slope, so that some of the winter moisture passes off, and does not enter the soil. Protection by means of hoops and mats should be afforded during hard frosts. Patches of these plants look well in the herbaceous perennial borders.

CROCUS, SNOWDROPS, AND WINTER ACONITES.—If the bulbs of these plants were taken up when ripe, they should now be re-planted. These form good edgings to beds and borders, and enliven beds of shrubs if planted amongst them in patches. The two first-named are also well adapted for forming designs on the turf.

NARCISSUS, JONQUILS, English, and Persian bulbous Iris, Allium Moly, Crinum maritimum, Ixias, Lilium candidum, Crown Imperials, and any other bulbs which were taken up when their leaves decayed, may now be planted.

THE ORCHID HOUSES.

By W. H. White, *Orchid Grower, Burford, Dorking.*

VANDAS OF THE TRICOLOR SECTION.—It is no uncommon thing to find these stately plants with stems bare towards the bottom for 1 foot or more, the cause of which will probably be found due to excessive flowering, irregular temperatures, insufficient ventilation, and a too dry atmosphere. Their cultivation is not difficult, and a group of them furnished with leaves strong and healthy down to the bottom, forms, whether in or out of bloom, an imposing feature in Orchid-houses; moreover, they furnish lasting flowers fit for large vases or other uses. A drying warmth in the Vanda-house is always detrimental, as it causes weak growth and unhealthiness. The plants should be grown in an intermediate-house, the temperature of which should be very steady, and the balance between warmth and aërial moisture duly observed. Some cultivators stand their plants on open wood-work stages immediately over or near to the hot-water pipes—the worst possible place for them. If they must stand over the pipes, the stages should be covered with flat tiles or thin slates, over which a layer of finely-broken coal or coke is laid to a depth of 3 or 4 inches, which will hold moisture, and render an injurious aridity impossible, if care be taken to keep the bed moist. Until the middle of the next month, repotting and surfacing of any of these plants that require it may be carried out. Some growers fear to interfere with Vandas after a considerable number of leaves have fallen, and consider that to cut them down is erroneous practice, and one which would lead to the death of the plants; but such fears are groundless, if the proper season for repotting be chosen, and care used, followed by a proper management of the plants. The summer of 1893 being a hot one, our plants lost more leaves than usual, and it became necessary to cut down most of them, an operation which was carried out in the month of November, the hot weather during October being unfavourable for it. I may add that there has been scarcely any loss of foliage up to the present time, and many of the specimens are from four to six feet in height, with foliage down to the rim of the pot. These plants being in such good condition will not be disturbed this season, and will be merely re-surfaced with fresh sphagnum. If a plant has to be re-potted, lift it carefully out of the pot in which it stands, gently easing off any roots that may be clinging to the sides with a thin-bladed knife, then remove all the stale materials, crocks, &c., about the roots. In most cases, plenty of live roots well up the stem will be found, which will allow of a portion of the stem being cut off, and so much should be removed that when the plant is placed in the new pot, the bottom leaves will be on a level with the top of the sphagnum. Before potting, a few large crocks should be put at the bottom, the roots replaced, but bringing them well up to the surface, working in amongst them clean or new crocks and a moderate quantity of fresh unchopped sphagnum-moss, pressing it down firmly, and filling the pot to within ½ an inch of the top, finishing off with clean, healthy sphagnum-moss well mixed with finely-broken crocks. Some growers prefer charcoal for drainage on account of its lightness, but I have never found that it had any other advantage, but rather the reverse, as it attracts woodlice. After potting, tie each stem in an upright position to neat wooden stakes, and peg down any of the aërial roots that are long enough on to the surface of the moss. These long roots will enter the moss, &c., affording nutriment to the plants, and aiding the retention of the lower leaves. The repotted plants must be shaded, one thorough watering afforded them, and the moss lightly sprinkled when it gets dry on the

surface, and by this means keeping it growing till the plants have become re-established, when more root-waterings may be afforded. The remarkable species Vanda Sanderiana is a difficult plant to establish; and Burford it succeeds in a light warm corner of the at East Indian-house, but some growers keep their plants with the Cattleyas the whole year round, and with good results. Wherever they are placed a plentiful supply of water is required when rooting freely, but at other times much less should be supplied. Vandas and V. Sanderiana in particular are liable to be infested by a small species of brown scale, and these should be constantly sought out and destroyed.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

ROOT-PRUNING OF APPLE AND PEAR TREES.—Young trees of the above kinds on free stocks, whose branches are pruned annually, are usually in need of, and repay for, an occasional pruning of their roots; and this operation is best performed as soon as the leaf falls. There is then a good chance, barring, of course, sharp frosts when the trees are in bloom, of obtaining a crop of fruit from them the next year. The best results will not be seen the first season, but in following years when the check given to the growth has told on them and become visible in the formation of a greater number of bloom-buds; and once a good crop of fruit is obtained, a tree may be kept in a fruitful state by regulating the amount of the crop, that is when the frosts spare it. Trees eight or ten years' planted, which have reached a large size, should be root-pruned on one side only at a time, and the operation spread over two years. The proper way to commence the operation of root-pruning is to open a wide trench, and excavate the soil about the roots from beneath as far as the stem of the tree, as regards small trees, and to the half-way point in old and large trees, cutting off all roots going downwards. The distance at which the first trench is made will depend on the size of the crown; it may be at 6 or 8 feet away from the stem, or as little as 5 feet, and no rule can be laid down for shortening those roots that spread horizontally. If the tree is small, 3 to 4 feet will be found a good distance, but larger trees must have greater length of root left. If the soil has been long in cultivation, like that of old gardens, the stations prepared for the trees should have some fresh pasture loam mixed with the staple. Before the root-pruning is begun, all the necessary branch-pruning for the season should be done, and this will consist of cutting back to two or three buds all the lateral shoots, if these have not been pruned back earlier, leaving the leading shoots longer or shorter according to the size it is desired that the trees should arrive at, removing also some of the branches where crowded, which is a matter easily determined whilst some of the leaves remain on them.

THE KITCHEN GARDEN.

By Arthur Coombes, *Gardener, Himley Hall, Dudley.*

BEETROOTS AND CARROTS.—These plants, owing to the unusually mild season, are still in active growth, but now that a change to colder weather has taken place, checking growth, the crops of both should be lifted, choosing dry weather for the job. The small roots of Beet may not be broken off, or the tops cut close to the root, but the heart-leaves and 3 or 4 inches of the older leaf-stalks left on them. There are several ways of storing Beet; it may, for example, be stacked in sand out-of-doors, covering the heaps in frosty weather with litter; or they may be similarly stored in a cellar or stood in trenches close together, with the soil closed in about them, covering the ground with litter in frosty weather. Whichever method is chosen, the tops must be exposed to the light. The worst place is a dry warm one. In storing, size the roots, and throw aside all that are of ugly shape, much forked, or of evident bad colour. The treatment of Carrots is much the same as the above. Late sown horn and other short-rooted Carrots will still make some progress; stir the soil between them, and if frost threaten, strew dry tree leaves amongst them.

TURNIPS.—The late sowings will take no harm from any frosts that are likely to occur before December, and therefore, none need be lifted. Full-grown bulbs will suffer from frost, and should, even if no frost occur, be drawn and clamped, not left in the ground to become woolly. The late sowings should have the draw-hoe used amongst them, and if manure-water or manurial dressings are needed, afford these forthwith.

CHICORY.—The first batch of roots may now be lifted, and packed thickly together in soil, either in 12-inch pots or boxes, placing these in the Mushroom-house, or a warm cellar. The shoots must be kept perfectly dark, to blanch them, and in a temperature not above 56°. In preparing the roots, leave one inch of leaf-stalk. The new tops should be cut or twisted off about half-an-inch from the roots. If the soil used be fairly moist, and the air also, water will not be needed before growth has begun.

CABBAGES may still be planted, and the hoe freely employed amongst the plants of earlier sowings, the soil being at the same time drawn up to the stems

ONIONS.—Where these have been laid out on floors other than of wood, attention may be needed in case these are damp, as the bulbs will quickly decay, or begin to form roots. They should be turned over several times, and when dry put into a dry but not warm store-room. The finest bulbs may be roped and suspended in a cool airy shed, where they will keep to later date than the others.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton, S.W.*

THE PREPARATION OF POTTING SOILS FOR NEXT YEAR.—It will be admitted by all persons engaged in gardening that the proper preparation of the potting soils leads to the best results. It is at this season and during the winter that the soils of which the gardener stands in most need should be got together. If the loam depôt is partly empty, some old pasture loam, sufficient in quantity for the whole year, should be cut, carted, and stacked. In stacking it, place a layer of fresh horse-dung between the layers of sods. Two qualities of pasture loam, a light and a heavy, should be obtained if possible, keeping them in separate heaps. I do not approve of the plan of stacking soils under cover, no matter how well the shed may be ventilated, for the heaps should be exposed to the elements, and the stacks so made that enough moisture enters the soil to hasten the decay of the roots of the plants it contains. The soil in which Melons and Cucumbers have grown, on the other hand, may be placed in a shed, and it will be found useful for seed-sowing and other purposes. Leaf-mould should be obtained by sifting the partially or wholly decayed leaves of trees, a large-meshed sieve being employed for the purpose. The mould should be placed under cover. It is not wise or even necessary to prepare it in large quantities, only just as much as will meet the requirements of a month or so. Lime-rubble, silver and other sands, charcoal, &c., should be got in. Peat-soil has usually to be bought, and it should, if fit for use at the time, be placed in sheds, at least that which will be needed during the winter. Large quantities should be stacked like loam, out-of-doors, but without any admixture of manure. All stacks of soil should be kept scrupulously free from weeds, and this is best done by shaving the top and sides with a sharp spade.

HERBACEOUS CALCEOLARIAS.—Pot these plants into 48's and small 32's, using loam one half, leaf-mould, horse-dung, and sand in equal parts forming the other half. Calceolarias are usually placed with the show and fancy Pelargoniums, and both being liable to be infested by green-fly, mild fumigation with tobacco-paper should be afforded them once a week. Cinerarias may likewise be fumigated at the same time.

THE STOVE.—The propagation of quick-growing plants, useful in furnishing and house-decoration, may still be continued; and recently-struck Crotons, Dracænas, &c., now standing in 60's may be shifted into small 48's, thus confining the roots in a smaller space than is requisite in the summer, placing these newly-potted plants on shelves near the glass. The increase of space in the stove consequent upon the removal of deciduous plants to the stove pits will afford the other occupants more space, light, and air than has been possible hitherto. Clean and re-arrange these plants, and stand Poinsettias and Tuberoses amongst them; the first-named lasting in good condition for a long time in the stove. A night temperature of 70° should be kept up, with abundance of moisture on the floors, and stages; and by day 90° may be allowed, provided the house be kept humid.

ADIANTUM FARLEYENSE is a species usually grown in the stove, but it is easily spoiled if the syringe be used on it, or it is exposed to drip. The plant should be so placed that it is not struck by the water when the other plants are syringed. If the fronds need support, a few slender sticks should be stuck into the soil.

FRUITS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

PEACH AND NECTARINE TREES.—Where the erection of new Peach-houses is contemplated, it is prudent to give very great attention to the contrivances for ventilating them [especially when the builders are not specialists. Ed]. The best best kind of roof is the lean-to, and the width, if for early forcing, from 16 feet to 18 feet, planted at first with two rows of trees, standards to be trained to a trellis against the back wall, which should be about 12 feet high, and dwarfs planted against a flat or curved trellis, the foot of which is distant 2 feet from the front wall. This wall, if built on arches, is better than a solid wall, as the roots can then gain access to an outside border. A border to accommodate the trees on the back wall may be 4½ to 6 feet wide; and it may be used as a footpath if covered with an open wooden trellis of battens, and cross-pieces. This gangway should be made in convenient lengths for easy removal. For the earliest peachery the roof-lights should be made removable at will, thus allowing full exposure of the trees after growth for the season is at an end. The hot-water pipes should be in number sufficient to afford the required heat without having to make them excessively hot at any time. A house 18 feet wide will require six rows of 4-inch pipes placed in the centre of the house, and one flow-pipe round the front and end; small pillars should be built in the borders to carry the hot-water pipes above the earth. For late forcing, a span-roof and a width of 25 feet make a very suitable house. It should be furnished with a wire trellis for dwarf-trained trees on each side, with temporary "riders" planted alternately between the permanent trees. The trellis should be 18 inches from the glass, and good provision for ventilation should be made at each side, and at the top of the house. Houses of a large span are often deficient in means of ventilation, and the trees are injuriously affected in bright weather if strict watch be not kept, the heat at the top of a 25 feet span-house being intense. To mitigate the evil, an opening not less than 2 feet wide ought to be provided the whole length of the house. The making of Peach-borders should be carried out in the same way as that recommended for Vines, but concrete is not required in porous soils. On clay-land, and in low situations, a Peach-house should be raised, as regards the site, a foot or more above the surrounding surface, which allows of a rapid drawing away of moisture, and gives a greater depth of good soil. A border may be 3½ feet deep, and 12 or 15 feet wide, and should have a slope of one in twelve to the front. The soil should be a strong turfy loam that has laid in stock for one year, which will not shrink so quickly as fresh soil and to every six cartloads of loam add one of lime-rubbish and charcoal and charred soil, with 1 cwt. of half-inch bones, 1 cwt. bone-meal, mixing all well together. The interior of the house should be a border as well. It is advisable as with Vine borders to make them by piecemeal, so as to benefit the trees by the addition of fresh soil. Good varieties for the early house are Peaches, Hale's Early, Royal George, Violette Hâtive, Abec, Gros Mignonne, Early Rivers; Nectarines, Lord Napier, Hardwick Seedling, Elruge, Hunt's Tawny, Violette Hâtive, Balgowan. For late houses, Peaches Sea Eagle, Barrington, Salway, Dymond, Walburton Admirable, Lord Palmerston; Nectarines, Pitmaston Orange, Pine Apple, Victoria, Rivers' Orange, Humboldt, and Prince of Wales. Plant young, strong, well-furnished trees selected from a good fruit nursery where the stock is known to be of the best quality. Old trees lifted from outside walls are well enough to fill such vacancies as may occur in old houses, but they look out of place mixed up with young ones.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication. — *All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY,	Oct. 23	Royal Horticultural Society's Committees at the Drill Hall, James Street, Westminster.

SHOW.

WEDNESDAY,	Oct. 24	Fruit Show and Conference at Worcester (two days).

SALES.

MONDAY,	Oct. 22	Dutch Bulbs, at Protheroe & Morris' Rooms. Ferns, Roses, Plants, &c., at Protheroe & Morris' Rooms.
TUESDAY,	Oct. 23	Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids, at Protheroe & Morris' Rooms. Clearance Sale of Nursery Stock, at the Nurseries, Sunningdale, Berks, by order of Mr. C. Noble, by Protheroe & Morris (three days).
WEDNESDAY,	Oct. 24	Dutch Bulbs at Protheroe & Morris' Rooms. Important consignment of Japanese Lilies, &c., at Protheroe & Morris' Rooms.
THURSDAY,	Oct. 25	Dutch Bulbs, at Protheroe and Morris' Rooms. Ferns, Roses, Plants, &c., at Protheroe & Morris' Rooms. Twentieth Annual Sale of Nursery Stock, at Hollamby's Nurseries, Tunbridge Wells, by Protheroe & Morris (two days).
FRIDAY,	Oct. 26	Dutch Bulbs, at Protheroe & Morris' Rooms. Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	Oct. 27	Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—48°.

The Pollination of Pear Flowers.

The United States Department of Agriculture has published an interesting paper on this subject by Mr. Merton B. Waite, in which he lays down lines of experimental procedure, which our fruit growers might imitate with profit. The general result of his observations and experiments with American Pears is the discovery of their extreme barrenness, as a rule, when self-pollination only has taken place, in comparison with the results of intercrossing. The importance of bees is thus shown to be very great, and it even suggests that some advantage might accrue to the Pear grower if he were a bee-master as well. Of course, it is impossible to say whether English Pears resemble the American in this respect without experimental evidence.

Commencing with preliminary remarks on cross-pollination, the author follows Darwin somewhat too implicitly, for he says that "the important laws which his investigations have so clearly demonstrated are now universally accepted by naturalists, as follows:—(1) Nature abhors perpetual self-fertilisation; (2) continued self-fertilisation is injurious, resulting in inferior and less fertile offspring; (3) cross-fertilisation is necessary for the production of healthy seedlings; (4) plants are needlessly modified to secure this end.

Not one of these dogmas, however, can hold its ground thus absolutely stated, but requires some considerable allowance for exceptions. It has long since been proved by Müller, Meehan, Henslow, and others, and it was admitted by Darwin himself, that self-fertilisation plays a large part in the propagation of plants in Nature, and is by no means always "abhorred." The very numerous habitually self-fertilised wild plants bear perfectly healthy and abundant seedlings. Lastly, plants are as often modified to secure self-fertilisation (as in "cleistogamy") as they are for being intercrossed.

What, then, is the interpretation of these apparently conflicting facts? The law of self-adaptation explains both. If a plant has long been specially adapted to insect visitors, its power of self-fertilisation is more or less interfered with, and may be in abeyance, but not necessarily lost. Thus, Darwin showed that Reseda odorata (put down by the author as one of fifty-seven self-sterile species) became, after artificial self-pollination for a few years, more fertile than the crossed offspring, for he says:—

"I expected that the seedlings from this semi-self-sterile plant would have profited in a higher degree from a cross than did the seedlings from the fully self-fertile plants. But my anticipation was quite wrong, for they profited in a less degree." The results were, for crossed to self-fertilised in height, 100 : 92; weight, 100 : 99; fertility, 100 : 100. Hence all differences had practically vanished. Similarly Eschscholtzia, which was self-sterile in Brazil, was not so in England, and in three generations Mr. Darwin raised its fertility as compared with that of crossed plants, in the proportion of 86·6 : 100. Where plants, however, have more or less lost for a time their power of producing plenty of good seed by self-fertilisation in consequence of having been habitually crossed for many generations, then experiments bring out clearly this superiority in the results of crossing; but the remarkable fact is that when the plant recovers self-fertilising powers, it often greatly surpasses the results of crossing.

Now many varieties of American Pears are evidently in the normal condition of requiring to be crossed. Consequently poor results come from self-fertilisation; so that the author's experiments show the trees to be divided sharply into two classes, those which can fertilise themselves, and those which cannot do so. The number of trees were 144, belonging to thirty-eight varieties. Of these, fourteen proved to be capable of self-fertilisation, but still were improved by crossing, as "they seemed to be less certain than under cross-pollination, and were less satisfactory in some seasons than others."

To give a few illustrations:—Three trees of Duchesse d'Angoulême, grown at Brookport, had 170 flower-clusters protected by net from insects; of these, 162 fruits were set, or 14·5 per cent.; while of 40 clusters exposed to insects, 107 fruits were set, or 36·3 per cent.

At another place (Rochester), six trees of the same variety of Pear had 163 clusters covered, of which 71 fruits were set, or 4·6 per cent.; while of 156 clusters exposed to insects, 133 fruits were set, or 15·4 per cent.

When crossed with the Beurré d'Anjou, a self-sterile form, the percentage rose to 22·5; d'Anjou itself, when exposed to insects, gave 15·7 per cent.

The variety Bartlett (Williams) is one of the partially self-fertile varieties, but yet it often fails when left to insects. Certain experiments, however, show "that it is a cross with a different variety that is needed, and that "individual" crossing (i.e., of flowers on the same tree) or even of two different trees of the same variety, is no better than self-pollination of the same flower."

Though Beurré d'Anjou and Williams are both more or less self-sterile, yet the pollen of each is fertile on the other. And the author adds:—"Doubtless, this is the general rule among all the varieties. It is the cross that is needed."

As an instance of a self-sterile Pear which is extremely fertile when crossed, the Kieffer Pear may be mentioned. Sixty-seven clusters on a tree produced no fruit whatever when protected, but when exposed to insects, thirty-seven clusters produced sixty-seven fruits, or 17·7 per cent.; while when six flowers were crossed with the self-sterile Bartlett, all were set, therefore the percentage was 100.

The characters of the fruits resulting from self-fertilisation and of crossing are different. The author has supplied twelve plates of photographs and engravings which illustrate the differences and appearances remarkably well. Thus the fruits of self-fertilised flowers are somewhat smaller as a rule, and have a shorter diameter in the broadest part, while crossed fruits are sometimes better shaped and broader in the thickest part.

The following are the general conclusions (abridged) at which the author arrives:—

"1. Many of the common varieties of Pears require cross-pollination, being partially or wholly incapable of setting fruit when limited to their own pollen.

2. Some varieties are capable of self-fertilisation.

3. Cross-pollination is (only) secured by using pollen from a tree of a distinct horticultural variety, i.e., which has grown from a distinct seed.

4. The impotency of the pollen is due to the lack of affinity between the pollen and the ovules of the same variety.

5. The pollen of two varieties may be absolutely self-sterile, and at the same time perfectly cross-fertile.

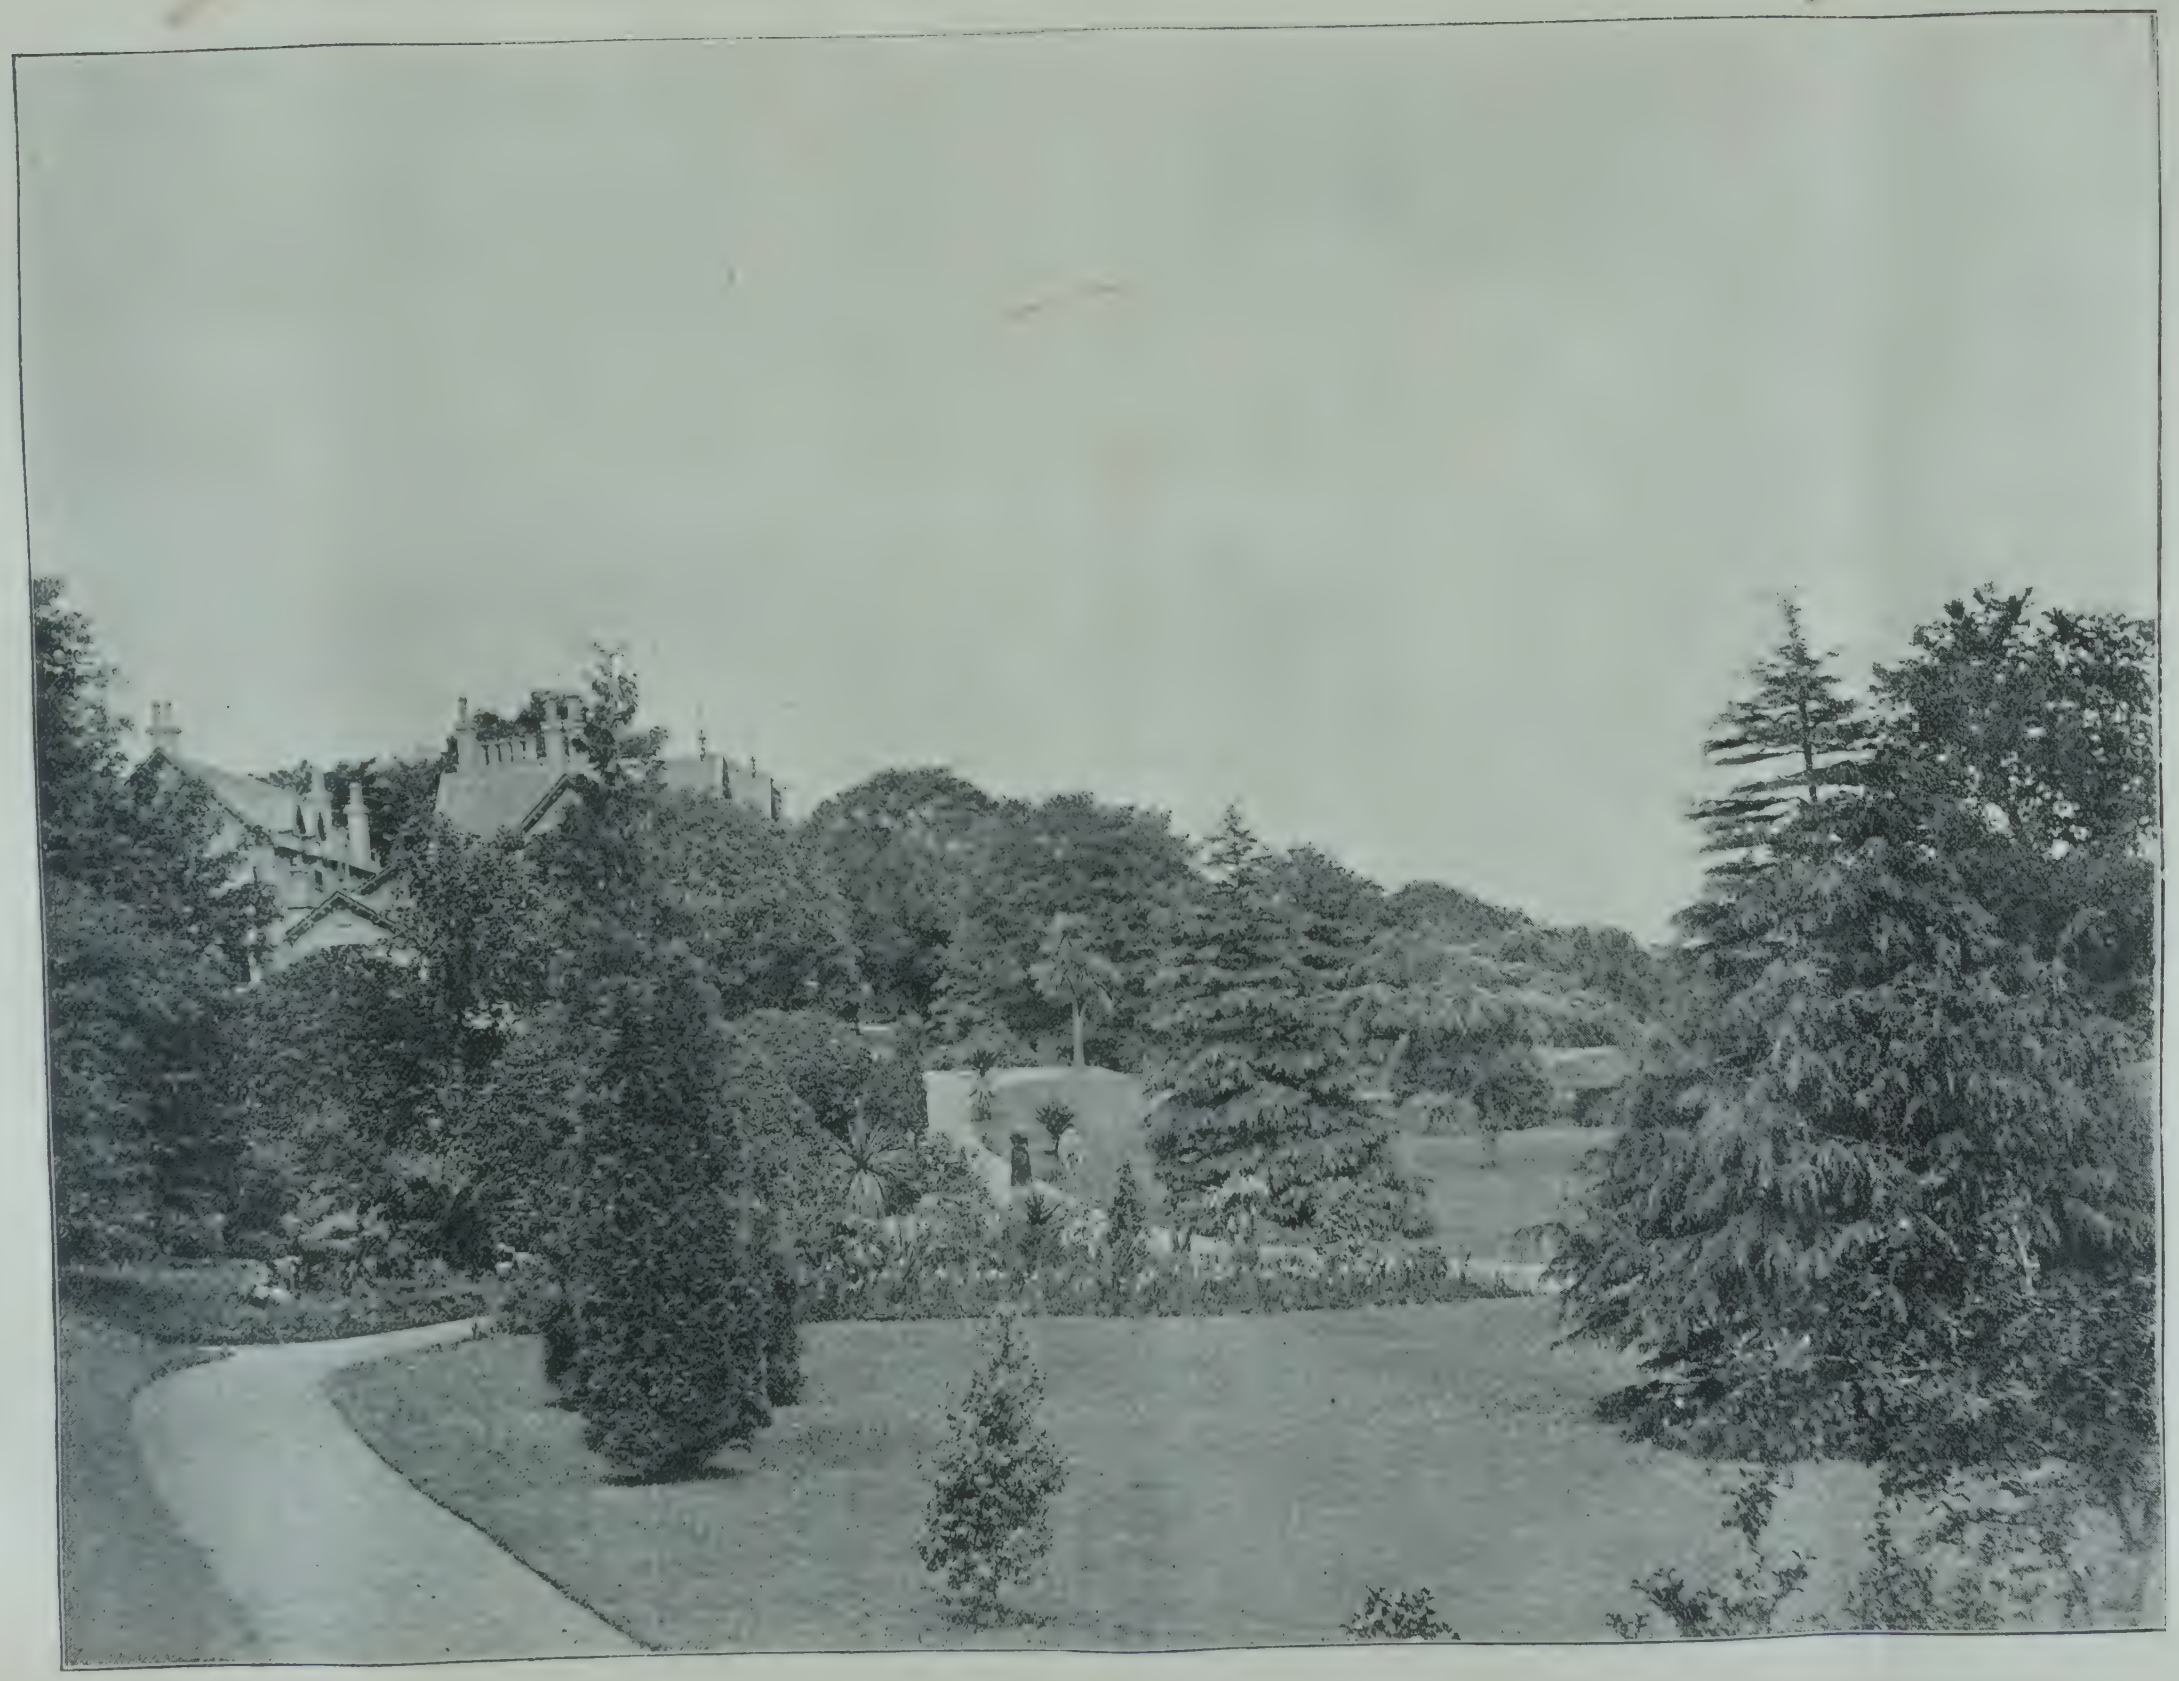
6. The state of nutrition of the tree and its general environment affects its ability to set fruit either with its own pollen or that of another tree.

7. Bees and other insects are the agents for the transportation of pollen.

8. Bad weather is injurious, while fine weather favours cross-pollination and the setting of fruit.

9. Pears produced by self-fertilisation are very uniform in shape. They differ from crosses not only in size and shape, but also in some cases in time of maturity, and in flavour.

10. Among the crosses the differences were slight or variable, so that their variations are not to be ascribed with certainty to differences in pollen.



11. Self-fecundated Pears are deficient in seeds, usually having only abortive seeds; while the crosses are well supplied with sound seeds.

12. Even with those varieties which are capable of self-fecundation, the pollen of another variety is prepotent; and unless the entrance of foreign pollen be prevented, the greater number of fruits will be affected by it.

13. The normal typical fruits, and, in most cases, the largest and finest specimens, either of the self-sterile or self-fertile sorts are crosses.

Practical Conclusions.

1. Plant mixed orchards, or at least avoid planting solid blocks of one variety. It is not desirable to have more than three or four rows of one variety together, unless experience has shown it to be perfectly self-fertile.

The Flower Garden, Ericht Bank, Kirn, N.B.

2. Where large blocks of trees of one variety which blossomed well have failed to fruit for a series of years without any apparent reason, it is exceedingly probable that the failure is due to lack of cross-pollination. The remedy is to graft in other varieties, and supply foreign pollen.

3. Be sure that there are sufficient bees in the neighbourhood, or within two or three miles, to properly visit the blossoms. When feasible, endeavour to favour insect visits to the blossoms by selecting sheltered situations, or by planting windbreaks."

ERICHT BANK: VIEW OF THE FLOWER GARDEN AND LAWN (see Supplementary Illustration).—Ericht Bank, a pretty residence, near Kirn, on the Firth of Clyde, is the property of W. BURNLEY, Esq. It is well situated to command a fine view of the Firth. The flower garden is well sheltered from the prevailing strong winds, and the general lay of the land is favourable for vegetation. The climate is salubrious, like that of many other places in South-western Scotland, and comparatively tender plants do well, surviving most of the winters experienced in that part of the country, as will be seen from the list of plants given below, for which we are indebted to Mr. W. HEPBURN, the gardener at Ericht Bank. The tuberous-rooted Begonias grow admirably, and flower profusely, far outdoing the zonal Pelargonium, bidding fair to supersede the latter in flower gardening. Camellia japonica in variety has been planted out-of-doors, and flower freely in their season; Phormium tenax, and its variety, Veitchii, with variegated leaves; such Palms as Rhapis flabelliformis, Latania borbonica, Chamærops Fortunei, grow capitally; as do the New Zealand Ferns, Dicksonia australis and D. squarrosa; tender Conifers, a variety of flowering shrubs, besides Roses, lend much unusual beauty to the garden. Cordyline australis forms a fine specimen planted out on the lawn, having attained a height of 18 feet, and girth of stem of 3 feet at 3 fest from the ground. The plant possessed in August this year five fine spikes of flower.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the society will take place in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, October 23. Besides the usual display of flowers, large collections of fruit are anticipated. At 3 P.M. the Rev. Professor GEO. HENSLOW, M.A., F.L.S., &c., will lecture on the "Origin of Common Vegetables, and their value as Food."

THE LINDLEY LIBRARY.—As many persons are unaware of the conditions upon which the Library may be consulted, we think it well to reprint the rules for its use, sanctioned by the Trustees:—"The LINDLEY Library, which by agreement is deposited in the rooms of the Royal Horticultural Society, is open for the use of the public under the following regulations:—1. The library is open for consultation on all week-days from 10 A.M. to 4 P.M.; except on the meeting and exhibition days of the Royal Horticultural Society. 2. The Trustees reserve the right of closing the Library for purposes of re-arrangement, cleansing, &c., when such may be required. 3. The Fellows and officers of the Royal Horticultural Society shall have access to the Library at all times, when it is open, on application to the Assistant-Secretary, Royal Horticultural Society. 4. Gardeners and others, not Fellows or officers of the Society, must make application to one or other of the Trustees, or to the Assistant-Secretary of the Royal Horticultural Society, for permission to use the Library, and shall sign their names and addresses in a book provided for that purpose. 5. Persons requiring the loan of books to be taken from the Library must make written application to the Trustees addressed to the librarian for the time-being, at the offices of the Royal Horticultural Society, who are prepared to accord this privilege on the following conditions, viz.:—(*a*). That the borrower be personally known to one or more of the Trustees or officers of the Society, or at least shall produce satisfactory references. (*b*). That the borrower sign a receipt for the volumes, before removing them from the premises, in a book provided for that purpose; undertake to restore the books in good condition, and generally to comply with the regulations laid down by the Trustees. (*c*). That not more than three volumes be lent to one person at the same time. 6. The Trustees will exercise their discretion as to what books shall be lent out; but, as a rule, unbound periodicals, expensively-illustrated works, and works of common reference, such as are likely to be in frequent use within the Library itself, must not be removed from the premises. 7. All books borrowed shall be returned to the Library within one calendar month from the date of issue; but an extension of time may be granted on application to the Trustees. 8. The Assistant-Secretary or acting librarian is empowered to demand of the borrowers such books as are detained beyond the prescribed time, and to take such steps as may be necessary to secure the prompt return of the same. 9. The loss of any book, or any injury sustained, shall be made good by the person who has lost or injured the same. 10. The Trustees reserve the right of repealing or altering these regulations from time to time, as may be required."

NATIONAL CHRYSANTHEMUM SOCIETY: FLORAL COMMITTEE, OCT. 10.—Several very fine novelties were submitted at this meeting, which was held at the Royal Aquarium, Mr. E. MOLYNEUX presiding. First-class Certificates of Merit were awarded to Japanese Duchess of York, raised from seed sent from Japan, to Mr. JAS. CARRUTHERS, Corstorphine, Midlothian, and exhibited by him, the colour pale yellow, narrow florets, large, full, and very fine, the award being unanimously made. To Japanese Souvenir de la petite Aimée, a large white variety of fine quality, having drooping petals, from Mr. W. WELLS, Earlswood Nurseries, Redhill. To Japanese Mrs. E. G. Hill, white, flushed with pink, a large broad-petalled variety, which also gained a unanimous award. Japanese T. H. Dennis, cinnamon and buff; and Japanese Madame C. Molin, a drooping-petalled white flower, from Mr. W. J. GODFREY, nurseryman, Exmouth. To Japanese Commandant Blusset, a striking flower, which opens of a rich deep crimson, changing to a bright magenta crimson, this also gained a unanimous award, and it was shown by Mr. E. Beckett, the Gardens, Aldenham House, Elstree, Herts. To Japanese Mrs. W. H. Lees, a large full flower, with fine drooping petals, colour sulphur and white, the basal petals delicate pink, the votes for this were also unanimous; from Mr. W. H. Lees, the Gardens, Trent Park, Barnet. Other fine Japanese were President Armand (Wells), Petite Delaux (Godfrey), Prefect Roberts (Godfrey), Winnie's Sweet (Beckett), Arthur Thatcher (Beckett), Montague (Piercy), an October-flowering decorative variety, of a chestnut crimson colour; and Lady Randolph (Molyneux), all of which the committee wished to see again. Plants of Nicotiana colossea variegata, and N. affinis variegata, several of the taller from seed being shown, were highly commended; Apple, Duke's Seedling, was commended, all from Messrs. J. Laing & Sons; and pink Princess May, a pretty perpetual flowering variety from Mr. Fred. Hooper, Bath, was also commended. The great autumn fête and exhibition will take place at the Royal Aquarium, Westminster, on Nov. 6, 7, and 8, when one leading feature will be illustrations of how all sections of the Chrysanthemum, and especially the large blooms of the Japanese varieties can be utilised for general decorative purposes. The whole available space of the Aquarium will be required to display the exhibits, and several valuable special prizes, in addition to the challenge trophy, the Holmes' Memorial Challenge Cups, and the President's piece of plate, are offered for competition. The annual dinner is fixed for Thursday, Nov. 29, and will take place at Anderton's Hotel, Fleet Street, Sir Edwin Saunders, President, in the chair. The musical arrangements will be conducted by Mr. J. Mortimer Dudman, the musical director of the Royal Aquarium.

HORTICULTURAL CLUB.—The first dinner and *conversazione* for the session 1894-95 took place on Tuesday evening, the 9th inst., and notwithstanding that the Gardeners' Provident Association had fixed their annual dinner for the same day, there was a good attendance of members; the chair was occupied by Sir ALEX. ARBUTHNOT, and there were present Messrs. ASSBEE, H. C. SEEBOHM, C. E. PEARSON, A. H. PEARSON, T. F. RIVERS, RIVERS, Jun., WEBBER, G. BUNYARD, COCKETT, and the Secretary. The subject for discussion was the abnormal Pear crop for 1894, which was opened by Mr. G. BUNYARD, in a very interesting paper (an abstract of which is given on p. 475). The paper led to a most animated discussion, in which all those present took part, and many curious facts were elicited. A cordial vote of thanks was proposed by the Chairman to Mr. BUNYARD for his excellent paper. The thanks of the meeting were given also to Mr. T. F. RIVERS for the sumptuous dessert which he gave to the members, consisting of dishes of Muscat of Alexandria and Madresfield Court Grapes, Doyenné du Comice, Beurré Hardy, Louise Bonne of Jersey Pears, and two dishes of splendid Cox's Orange Pippin (Apples). Mr. COCKETT also brought before the meeting a piece of a branch of Ne Plus Meuris Pear, showing the enormous crop produced so near to London as Wanstead. He also had a fine specimen of Pitmaston Duchess from the same locality.

MARKING FOREIGN AND COLONIAL FRUIT FOR THE ENGLISH MARKETS.—The second report of the select committee of the House of Lords, on marking of foreign and colonial produce, states that it has been shown that much misrepresentation is carried on by the sale of foreign fruit by the appellation "English," and that it is customary for the agents of jam-makers in many cases, to supply fruit-growers with baskets stamped with their own name or initials. On the arrival in the market there is nothing to show which are the baskets containing foreign and those containing English. The Lords' committee are of opinion that where the mark on a package, though only that of the owner, or the address, can be shown to the satisfaction of the Customs Commissioners, in effect to be misleading to the customers, these commissioners should frame and issue an order for detaining such packages. To prevent the use of unsound fruit, it is suggested that an efficent inspector should be placed at the ports, and in the factories of fruit arriving in closed casks. Their Lordship's committee are of opinion that the competition, though severe, between English and foreign fruit is not, except in so far as wilful misrepresentation is carried on, on the whole unfair. The committee would appear to be in favour of extending the trade-mark system to all packages of fruit and pressed fruit imported into this country from abroad, and this would seem to be fair. The Board of Trade might easily suggest stencil marks for exporting countries for boxes and barrels and other packages of wood or metal—those of other material could have the foreign index pressed on the address. Of course, identity of contents with invoice ceases when once the fruit is turned out for sale by retailers—the senses of the buyer must, we think, be trusted to guide him to value for money. Respecting foreign jams, we are of opinion that the place of manufacture should be boldy indicated on the jar or bottle—the sanitary condition of certain foreign cities wherein jams are made being very strongly marked. But after all, we fancy our Board of Trade can manage all this without an Act of Parliament, of which there is a sufficiently large supply now on hand.

CROPS ON THE RIVIERA.—Mr. THOMAS HANBURY writes from La Mortola, near Mentone, "The past summer has been normal, the usual drought of three months being only once broken by a violent storm, when on July 11 fully 2 inches of rain fell in a very short period. The vintage proves to be above the average in quality, but the yield is not great. Olives are almost a complete failure near the coast,

but in the mountains a good crop will be gathered; this is, Mr. Hanbury considers, one of the worst trees to cultivate, the yield being so very uncertain. The peasants are much depressed at the miserable price their Lemons realised in the early summer, as low as 5*d.* per 100 for fair quality—not the best. The following are now in blossom in Mr. Hanbury's garden in the open air:—

Acacia Farnesiana, Willd.
Aloe aurantiaca, Baker
Berkheya grandiflora, W.
Bignonia Chamberlainii, Sims
Bougainvillea glabra, D.C.
Cantua bicolor, Lindl. and Paxt.
Carica cundinamarcensis
Cassia Barclayana, Sweet.
Cyrtanthera magnifica, Nees ab. E.
Encephalartos Altensteinii, Lehm.
Eucalyptus leucoxylon, F. v. Müll.
Erythrina caffra, Thunb.
Inga pulcherrima, Cerv.
Pleroma macranthum, Hook.
Polygonum equisetiforme
Quebracho colorado
Rondeletia speciosa, Lodd.
Royena pubescens, Willd.
Schinus terebinthifolius, Radd.
Yucca guatemalensis, Baker

In Fruit.

Aberia caffra, Hook.
Diospyros kaki
Ephedra altissima, De f.
&c.

Pertetual-flowering Pinks.—We have received from Mr. B. Ladhams, Shirley Nurseries, near Southampton, a box of fine blooms of his new perpetual Pink Ernest Ladhams, which have been cut from the open beds. The plants being full of bloom so late in the season, the variety is a good one to plant for supplying cut blooms.

Shirley, Southampton, Mutual Improvement Association.—The monthly meeting of this Association was held at Shirley, Southampton, on the 15th inst., a good attendance of the members being presided over by W. H. Rogers, Esq., J.P., in the unavoidable absence of the President. "British Fungi" was the subject of the lecture, most ably dealt with by the Rev. W. L. W. Eyre, Rector of Swarraton, Hants. An interesting discussion followed. A vote of thanks to the lecturer was most heartily accorded and responded to. There was a large collection of Fungi, numbering over a hundred varieties, contributed by Mr. W. H. Rogers, Mr. E. Bartlett, Mr. E. G. Wilcox (forty varieties), Mr. Rishridges, and some from the New Forest by Mr. Hobby and Mr. B. Ladhams, F.R.H.S.

Peaches.—It sounds curious to English ears to hear a gardener at the present day recommending the propagation of certain good varieties by budding, instead of raising them from seed, which, as he says, is unsafe! Yet the latter is the common method in parts of Germany.

Alteration of Dates of the Manchester Chrysanthemum Show.—The above exhibition will be held on Friday and Saturday, November 23 and 24, instead of 20 and 21.

Vines and Peaches.—On the occasion of the meeting of the Verein zür Beforderung des Gartenbaues in den Preussischen Staaten (Horticultural Society of Prussia), on September 27 (*vide Gartenflora* for October 15, 1894), a large quantity of Grapes, in considerable variety, was shown by Mr. Schreiber, gardener to Trade Councillor Veit-Steglitz. These Grapes were the produce of Vines grown under glass, and consisted of varieties which are commonly found in vineries in this country, such as Gros Colmar, Golden Champion, Foster's Seedling, Madresfield Court, Black Hamburgh (Frankenthal), Mrs. Pinces' Black Muscat—much cultivated in Silesia. Some bunches of Black Hamburgh weighed 2½ kilos. Golden Champion was distinguished as one of the best varieties, a character it does not receive in this country, and of which Mr. Veit-Steglitz had harvested 14 cwt. this year. The gardener asserted that the decay of the berries of Grapes was due to too much syringing, and he only damped the paths. The disease of the footstalks of the berries (shanking) is the consequence in part to too humid an atmosphere, in part to drought, and lastly, to the removal of the shoots and leaves whilst the Vine is in full growth. From the time the berries begin to colour, no more trimming of the Vines should take place, not even to give them a tidy appearance. At this period the leaves are beginning to produce starch, and through that sugar is formed; the Grapes themselves require little then, if any, sunshine. When great heat prevails he uses shading, and shades the Vines after thinning the bunches.

Woolton Mutual Improvement Society.—This Society commenced its sixth session by a horticultural exhibition and instrumental and vocal concert, in the Parochial Hall, Woolton, on the 3rd and 4th inst. The committee being desirous that their *réunion* should be enjoyable and instructive, exhibitors were invited to stage the produce of their gardens in what form they pleased, the Society offering prizes in kind. The results were very satisfactory, many good exhibits having been sent by Messrs. J. Grant Morris, Allerton Priory (gr., Mr. J. Craven); F. H. Gossage, J.P., Camphill (gr., Mr. J. Jellicoe); G. H. Warren (gr., Mr. Ellis); H. Cunningham (gr., Mr. W. Wilson); J. Stephenson, Woolton Hall; Arthur Earl, T. Sutton Timmis, J.P. (gr., Mr. B. Cromwell); Mrs. Cope, Dove Park; Mrs. Duncan, Fernlea, &c.

Floral Decorations at Leeds.—It is stated by a correspondent, writing under the signature of "Urbanus," that upon the occasion of the recent visit of their Royal Highnesses the Duke and Duchess of York to Leeds, floral decorations were very abundantly displayed by the principal tradesmen of the town, plants being freely used with good effects. The Town Hall, Victoria Hall, Yorkshire College, Medical School, were highly decorated, large Palms and other foliage plants, and a great number of plants in blooms being made use of. The fine Town Hall was thrown open to the public after the Royal guests had left, and thousands of persons were admitted. In the decorations, more than 100 vases and baskets, filled with choice flowers, were employed; the banqueting-tables, and the beautiful bouquet presented by the Yorkshire College to Her Royal Highness the Duchess of York, was a masterpiece of the floral art—it consisted of Dendrobium Schroderianum, Cattleya labiata, Vanda cœrulea, Odontoglossum Alexandræ, relieved by Lily of the Valley. Mr. Featherstone, of the Kirkstall Nurseries, had the honour of furnishing this most artistic bouquet.

Sale of Pickering Lodge Orchids.—The last of the lots of this very fine collection of Orchids, was under the hammer of Mr. Protheroe during Tuesday, Wednesday, and Thursday, October 16, 17, and 18, and attracted a very large company. The prices realized were such as one is not accustomed to see in these days, when Orchids are sold every week by the 10,000. It must have been exceedingly gratifying to horticulturists present to see the demand not only for the rare species and varieties, but for every description of plant, showing that recruits are forthcoming in this northern portion of the kingdom to swell the ranks of the rapidly increasing band of Orchid amateurs. The first day's sale netted £1124, or rather more than an average of £3 per lot, and the chief prices realised were 100 guineas for Cattleya Massaiana, a mixture of the gigas and Sanderiana blood; 70 guineas for a plant in indifferent health of Cattleya Hardyana; 50 guineas for Lælio-Cattleya calistoglossa; 75 guineas for small pieces of Lælio-Cattleya bella, and the original Cattleya Reineckiana; 22 guineas for Lælia Tresederiana superba, and lots of others from 20 guineas downwards. On the second day there was great excitement at the bidding of the following lots: Cypripedium insigne Sanderæ, a small, healthy plant in a 4-inch pot, beginning at 100 guineas, and latterly knocked down to the son of the late owner at 260 guineas, a price that has only been eclipsed when Cypripedium Stonei platytænium was sold. This plant was bought by the late Mr. Hardy a fortnight before his death, from Messrs. Sander, for 100 guineas. Also a fine piece of Lælio-Cattleya bella at 150 guineas; Cattleya Schroderi alba 160 guineas; a white Sobralia (small plant), 50 guineas; and corresponding prices for anything choice. The second day's sale realized £1475, or rather over £4 per lot, and among the principal buyers were Mr. F. Hardy, Mr. Thos. Statter, Mr. E. Ashworth Mr. G. Ball, Messrs. Veitch, and several other nurserymen.

Newcastle and District Horticultural Mutual Improvement Society.—The monthly meeting of the above Society was held on October 9, at 25, Westgate Road, at which Mr. Bullock presided. A paper on the "Cultivation of Mushrooms" was read by Mr. Wallace, Oakwood.

New Publications.—*Text-Book of the Diseases of Trees*, by Professor R. Hartig, translated by W. Somerville, D.Œc., revised by H. Marshall Ward. (Macmillan)—*A Manual of Exotic Ferns and Selaginellas*, by E. Sandford. (Elliot Stock.)—*Flore Coloriée de Poche à l'usage du Touriste dans les Montagnes de la Suisse, de la Savoie, du Dauphiné, des Pyrénées du Jura, des Vosges, &c.*, par H. Correvon. (Paris: Paul Klinsksieck, 52, Rue des Écoles.)

MOTHS ON FRUIT TREES: THE WINTER MOTH, CHIMATOBIA BRUMATA.

The Board of Agriculture are advised that the season is approaching when the Winter Moth and other dangerous moths will commence laying their eggs. It has therefore been deemed expedient to warn fruit growers on this subject, and to suggest methods of diminishing the danger.

In the beginning of October the winter moth and the mottled umber moth will come from the chrysalis state in the ground under and near the fruit-trees that were infested in the spring, and the female moths will crawl up the trees for the purpose of laying their eggs upon the twigs and branches (see fig. 62).

It is most important that the passage of these moths up the trees should be prevented. This can be effected by putting sticky compositions round the stems to entrap the moths, or apparatus of wood or tin, or other material, such as stout varnished cardboard, to bar their progress, as they are quite unable to fly, having only rudimentary wings.

Fruit growers who put compositions round their trees last autumn early, and renewed the applications from time to time, and carefully attended to these measures of prevention, were rewarded with good crops of fruit.

These measures must be adopted early in October, and the compositions must be kept in working order as long as moths are seen about.

Tar has been found to injure young trees by causing their bark to contract. It should therefore not be used, except, perhaps, for old trees with thick layers of bark, and in this case it should be largely mixed with grease.

Some manufactured compositions have also been found injurious to the trees. Great care should be taken in the selection and application of all compositions whose ingredients are unknown.

Cart grease made from fats or oils, and without tar, is recommended by practical fruit growers as the best and safest substance. This may be applied directly to the stems, or put upon wide bands of tough grease-proof paper, like that used by grocers, fastened round the trees with string, or bass, or rushes, like those for tying hop bines.

As constant greasing may injure trees, especially young trees, it would be most desirable to adopt the system of spreading the grease upon grease-proof paper bands. When these are employed for old trees their rough bark should be scraped away, in order that the paper may be fastened closely round the stems.

Upon some fruit farms lighted lamps are hung over tarred boards near the fruit trees, at dusk, to entrap the male moths which sometimes carry the females into the trees.

The chrysalids, from which the moths will soon come, are now in the ground near the trees, and, probably, immediately under their boughs. Many chrysalids might be destroyed by digging or hoeing,

in the case of cultivated land, where the trees have been infested, or by digging in or hoeing in lime. Upon grass land the grass should be cut off and removed, or fed off closely. After this the surface might be raked with large iron garden rakes. This would expose the chrysalids, many of which could be smashed if the ground after the raking were beaten down with shovels. *Board of Agriculture, 4, Whitehall Place, October*, 1894.

THE ABNORMAL CROP OF PEARS, 1894.

[A Paper read at the Horticultural Club, October 9, 1894]

The cause of the unusual crop of Pears this season is not far to seek. Pears did not carry much fruit in 1893, and the exceptionally dry and warm season ripened the wood thoroughly, while the autumnal rains plumped up the fruit buds and completed the laying up of organic forces, and the trees were prepared to do their best. They were somewhat early in bloom, and thus escaped the severe frosts that obtained while the Apples were in blossom, and as for the most part the blossoms are pendent, the stigmas were less exposed than in Apples. Thinning had to be seen to very early, and many of our trees required nine out of ten of the fruit which had set to be removed at the first thinning, and twice since that they have been gone over.

The very cold nights and wet days of May and June, caused many to drop, as they were unable under these conditions to progress, and it is noticeable that the fruit near the ground was much affected by spot (Cladosporium dendriticum). This fungus hardens the skins, and when the fruit swells it cracks and becomes useless. It is evidently risky to try and grow such Pears as Easter Beurré, Bergamot d'Esperen, Glou Morçeau, Passe Colmar, Winter Nelis, Beurré Bachelier, and Beurré Diel, while Beurré d'Amanlis, otherwise than on a wall, even in our favoured part of England, has not been good this year; and on the other hand the clean handsome fruit of the late sorts, viz., Duchesse de Bordeaux, Doyenné d'Alençon, Marie Benoist, Beurré Du Buisson, Josephine de Malines, Olivier des Serres, Passe Crassane, Beurré d'Anjou, President d'Osmonville, Brown Beurré, Baronne Mello, and Duchesse d'Angoulême among autumn Pears are unusually clean, thanks to the well-ripened wood of 1893; and it is evident we ought to thin out the branches of our pyramidal and espalier Pears in the open more than we do to get high class fruit on these Pears, and we must not be led away by the fine examples of such a year as 1893, when the tender Pears were superb in quality if somewhat out of season, for the kinds which ripen after Christmas were mostly over by November.

Taken as a whole, the season of 1894 has been unfavourable to the production of clean, handsome, large Pears, and it may probably be well to note those that have been good this cold, wet season. These were: Beacon, a really nice fruit, led off the season. This is a remarkable bearer, and if not left on the tree too long, is quite fair as regards flavour. Clapp's Favourite has been large, clean and handsome. Williams' Bon Chrêtien has been large and good, but rather spotty, and in beauty cannot approach Dr. Jules Guyot, which is gaining favour rapidly as a market fruit. Petite Marguerite will be one of our best August and September Pears. It is of Bergamot shape, and very sweet and pleasant. Fondante d'Automne is not so large as usual, but as good in quality as ever. Pitmaston Duchess, very large and good; this monster Pear is much improved in flavour if it is gathered before it is quite fit and laid by. Beurré Hardy is grand this season, and the crop is the heaviest we have seen. The clean fruit of this variety in the shops from California in September were remarkable. Louise Bonne and Marie Louise are not so good as usual, the weather being too wet and cold for these sorts. Our favourite Pear, Emile d'Heyst, is finer than ever. It is a pity people do not plant this in place of Marie Louise; its pleasant acidity would be greatly appreciated. Conseiller de la Cour is the best crop ever seen, and the perfumed flavour of this kind will always make it welcome; it does well on the Quince in cold soils. Beurré Bosc is not bearing well this year. An orchard tree has a quarter of a crop, but the fruit will be small. Beurré Jean Van Geert is very handsome, and a free bearer, not yet ripe. The red flush on the sunny side will be admired on the dessert-table. Beurré Superfin is small, but a good crop. This may be called an improved Marie Louise. Doyenné Boussoch is very fine on pyramids, and quite clean and good. Doyenné du Comice, fruit rather irregular, owing to the season, but a good crop, and will yet grow to size.

Among the new Pears which have been good are Marguerite Marrillat, a monster fruit, ripening in September, of delicious flavour, melting, and altogether A1, and will take a high position; it bears freely and grows grandly. Beurré Mortillet is another very fine kind, ripening in September; of an unsightly shape, being, so to speak, like a Malta Fig, and generally one-sided, but superfine in flavour. Rivers' Conference is a grand bearer, and the long russety fruit is most elegant, while the flavour is very fine; the habit of the tree is perfect, and it will certainly rank A1. Beurré Fonqueray makes a fine cordon, and is giving us a little fruit, but not yet ripe to report on. It is hardier than Beurré Bachelier, and will probably supersede it. Triomphe de Vienne is

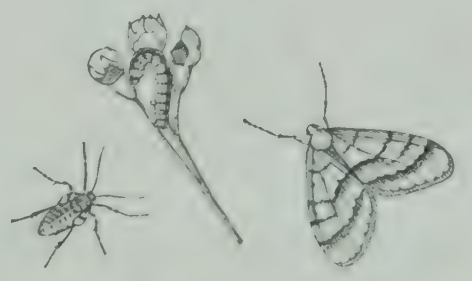


Fig. 62.—THE WINTER MOTH. (SEE P. 474.)

again grand; an enormous bearer, and of fine quality, juicy, and very handsome, being long and russety. Comte de Chambord is a fine bearer (on Pear only) of the Swan's Egg type, very rich, and of Bergamot flavour. Beurré Baltet Père is again grand; it ranks A1 for a close-growing kind, and is large, juicy, and good. Fondante de Thirriot has an enormous crop of clean fruit; a grand, little-known Pear for November. It should be borne in mind that my remarks refer to Pears quite in the open—i.e., not on walls or fences or under glass culture, as for all practical purposes this is the largest culture. Another reliable Pear for general culture is Belle Julie, small, but a great bearer, and of first-class flavour. Stewing Pears are all good, but the very large sorts—Grosse Calebasse, King Edward, General Todtleben, Beurré Clairgeau—are scarcely so big as usual.

A host of better known Pears has necessarily been passed over, but it is probable that we may be years before we see fruit of such a large collection. About 200 kinds have fruited this year, and we shall be able to gain much useful information when they have all been tested. We feel no doubt that, good as the 1894 crop is, we owe it more to the sun of 1893 than to any weather we have had this year. We are fruiting several novelties which may be noticed hereafter, but as a general rule planters cannot do better than stick to the varieties which are now named, for if good in a cold, sunless, and wet season, they will be grand when old father Sol is more propitious. For the poet truly says of him:—

"Hail! Life-giving soul of creation
* * * *
Source of Fertility, Diffuser of Radiance."
* * * *

As may be expected, the Pears on the water-loving Quince stock have come to the front this year, while the same kind on Pear show many spotted leaves, but on both stocks they appear to have made ample provision for next season's fruit.

A word as to orchard Pears. Generally the crop has been enormous, and low prices have ruled. We sold 50 to 60 bushels of Hessel on the trees for 25*s*. For once the town-dwellers will have cheap Pears, and wise growers will severely thin the boughs of their trees as soon as picked, or they will not get a return for many years after the trees have endured such a strain.

Before concluding this skeleton paper our hearers may be as surprised as the reader to learn that in an old book (1650) entitled *The Spirituall Use of a Garden of Fruit Trees*, the writer recommends grafting the Quince on the Pear stock for standards; while in another ancient book (1757) *Eden, or a compleat book of Gardening*, by John Hill, p. 514, of which we possess a complete folio copy, the author states that, "The Quince stock agrees very well with Pears, and should be chosen for those kinds which are melting." He also recommends it for espaliers and bushes, and this agrees with our practice to-day, as the gritty and crisp Pears are not so satisfactory on the Quince stock. The practice of working Pears on the Quince would therefore appear to be more ancient than is generally supposed. *George Bunyard, Maidstone.*

CHRYSANTHEMUMS ABOUT LONDON.

The present year is fast approaching its end, and hopes that have lingered during the whole of a not too favourable summer, that a change might result in an appreciable spell of sunny weather before autumn set in, have now to be abandoned. The advent of fogs and Chrysanthemums proclaim that such hopes are now impossible of fulfilment. Though coupling the Chrysanthemum with the distasteful and unwelcome fogs, it is from no other reason than that they invariably visit us at the same season, and we recognise that the nuisance of the latter is very largely compensated by the presence of such glorious and inspiriting displays as are furnished by the former.

As far as one is yet able to see, it appears very certain that in the near future, at any rate, the Chrysanthemum monopoly of our admiration during the autumn is not likely to be seriously disputed by any rival. As previously, it will reign unique all through our land from this date until well-nigh Christmas, and the shows devoted exclusively to its honour, and the space allotted to its display in every garden, denote a popularity enjoyed by no other flower except the Rose, though in regard to the Rose it may be remembered that this flower enjoys a similar popularity during a season when flowers of every description are numerous, and when it is much more remarkable that so large a share of admiration should be commanded by one of these, than in November.

As to the season that has past and its effect on the Chrysanthemum, there are only a few remarks required. Quite opposite in character to that of 1893, it has not been any trouble to secure water for the plants, and therefore the necessary labour that has been required by any one collection has been considerably below that requisite last year. As far as we have yet been able to observe, and from reports that have reached us from many of the large growers, the general appearance of the plants at the present time promise a richer bloom than last season, and the plants are in better condition and appearance. Especially will this be noticeable in the incurved section, which made such a poor show in 1893, that at the great show at the Aquarium even, the stands of incurved flowers were much below the average quality. There is one respect, however, in which we shall be surprised if there will not be a falling off from last season, and we refer to the colour of the flowers generally. The absence of the sun during the present season is very likely to result in blooms with

less perfect colour than those of last year, though in size they may excel them. Generally, also the plants are a trifle later in flowering.

The Inner Temple.

The display in the gardens belonging to the Benchers of the Inner Temple, though smaller than most of the others, was the first exhibition of the kind opened to the public. The plants are a little later than usual here, and the exhibition was only opened on Thursday, the 17th inst. The houses in which the plants may be seen, afford only very limited room in which to stage them, and this circumstance, together with the central position in which Mr. Newton has to grow his plants, are points to consider when criticising the quality of the display. Visitors will notice many of last year's novelties in good condition, and most of the better-known varieties are represented in the 600 or more plants that have been crowded into the house. The fine golden-bronze or chestnut Japanese, Col. W. B. Smith, had good buds, partly developed, and promise fine flowers in about a week after these notes are printed, and the general display will be at its best about the same time. Louis Bœhmer, and the white variety of this hirsute flower were noticed in good form, and the broad-petalled fine rose-coloured Japanese W. Tricker, also Viviand Morel, Sunflower, Puritan, Val d'Andorre, Prince of Wales, and Mrs. A. G. Hubbuck, are among the popular kinds in good condition; and among the novelties of last season may be mentioned W. G. Childs, valued highly for its splendid colour, William Seward, Chas. Shrimpton, Baron Hirsch, the new and popular incurved, and Chas. Davis. The collection is sure to be visited by a large number of people, who will not be able to see the larger collections further removed from the Strand.

The Parks.

The displays annually created in most of the London parks have already been opened, some of them as early as a fortnight ago, and though perhaps we have nothing new to chronicle respecting these exhibitions, we have again to congratulate all concerned that in so many centres in the metropolis, there are splendid collections open to the populace free of any charge whatever, save such as is met by the rates for the management of the parks. Frequently, through reluctance to spend more money than absolutely necessary, and therefore possessing only inconvenient arrangements for growing and housing the plants, the hands of the Superintendents are not free to do just as they would like in introducing additional varieties or numbers, and in making new features in arranging the display, &c.; and any criticism offered upon such collections must be made with due regard to such circumstances. To many an observer who visits the parks it will occur, that whilst the Japanese, decorative, and incurved varieties are grown largely at each place, it is at the expense of the Pompon section, the quilled or Anemone-flowered varieties, and to the almost complete exclusion of the pretty single-flowered section. This is a pity, and each display would be far more interesting if all the sections were well represented—not necessarily in the same degree—that the flower-loving public could compare one with another, and thus become familiar with the differing forms and attractions of the flowers. Again, in several cases, only a percentage of the plants are labelled prominently, and another source of interest and instruction is lost. Printed labels are not very expensive, and if care is taken to preserve them from season to season the cost of a sufficient quantity would be little. The arrangement of the displays is a little better each year, but much more might be done to add variety and pleasure; and above all, the plants should be grown dwarfer, or a proportion of them, that the whole effect of the groups be not destroyed by the sight of long, bare stems, and ugly flower-pots. In several parks there is required some additional direction to the visitors as to what position in the park is situate the house in which the display is made.

Battersea Park.

The exhibition in this very well-known park is arranged in the same house and under same system as last year, with sloping banks on either side, and a path through the centre. Everything is very neat, and considerable additional effect has been produced by training some of the longest of the plants on to the iron supports that cross the house, thus making a kind of arch each side, partly over the group. The house contains about 2000 plants, and the display was opened to the public on the 6th inst. In the early days of all these exhibitions, a prominent position is taken by that capital white variety Avalanche, and the incurved Mons. R. Bahuant—both of these are very valuable at the commencement of the season. Charlotte de Montcabrier is in very good form at Battersea, and Florence Davis, also a variety that is not happy at every place, yet seems to be pretty easily managed in the Metropolis. Here there were splendid blooms partly developed, and four of them on a plant. Chas. Davis was in about the same stage of development, and the new G. W. Childs also. Gloire du Rocher is another variety done well here; it has capital bright colour, and is prominent among the Japanese. Mons. Tarin, a narrow-petalled Japanese, of good rose colour, not by any means new, is valuable for decoration. Etoile de Lyon, as usual early in the season, was devoid of colour; but Bouquet de Dame, Cæsar Costa, William Tricker (capital colour), Viviand Morel, Louis Bœhmer, and the white variety, and Elaine, were remarkable. This good old variety has not yet dropped from collections, and when well grown, there are but few that equal it; there are larger white ones, but none prettier. Madame Edouard Rey, a very large Japanese flower, of rose, and reverse yellow, must be mentioned as one that has been very good in the early part of the exhibition; and the same might be said of L'Ami Etienne, a large incurved Japanese of pale mauve colour; this was trained along the iron rods mentioned above. H. Shoesmith, one of the newer Japanese, of pale yellow, had fine buds, and will give good blooms; this variety, it is expected, will prove to be a valuable one. The new Duke of York, a Japanese incurved flower of deep silver pink, and very broad petals, was not yet out, but it will have a few fine flowers. President Borel was noticed, and when a good colour this large variety is effective. Madame Clemence Audiguier, that has long been considered of bad because too tall habit, was trained along the rods, and in this way looked well. Good blooms were almost developed of that magnificent white and wide-petalled Japanese Mdlle. Marie Hoste; it is very handsome, with a pale yellow centre, but unfortunately does not stand the fogs for any length of time. Madame Darrier is a bright little incurved flower, and in this collection its colour is unusually bright. Stanstead White will carry good flowers; and Miss Watson, a neat yellow Japanese, and J. R. Pearson, are noticeable. The last-named is very pretty when it has opened, but it afterwards loses its colour entirely. President Hyde and William Seward are new ones also noticed here.

Southwark Park.

The park at Southwark is among the most unfavourable of all for the growth of Chrysanthemums, and most other things. The district is densely populated, and the part is black indeed. Last year we had to mention that Mr. Bailey had a new house at considerable cost in which to display the Chrysanthemums, and the collection now on view is in this structure, together with the small house that previously stood. They form an ill-made T, one of the upper arms being of greater length than the other. For the purpose they are used for the houses are fairly convenient, and the rafters of the roof being clothed well with Cobœa scandens and other plants, a pretty effect is produced. The arrangement of the plants here also is different and more tasteful than at most of the other parks, all of them being in irregular groups with serpentine margins. Mr. Curle, the present Superintendent, has a very large collection, including many of the best varieties, and we noticed a good number also of varieties which have been known for years, such as Peter the Great, Elaine, and others, that are of good quality; Condor, Mons. R. Bahuant, Gloire du Rocher, Beauty of Exmouth, Robert Cannell, Louis Bœhmer, Amos Perry, Edwin Molyneux, Mrs. F. Clinton, William Tricker, Sunflower, Madame Melaine Fabre, and Mdlle. Elise Dordan, were those most worthy remark a few days since. It would be well if the plants had more labels, that the general public could see at a glance those of the varieties they like best. If printed labels are scarce, the effect would not be marred if several plants of a kind were placed together, and a label attached; indeed, this arrangement is preferable, now that so few blooms are grown on a plant, as affording sufficient of a kind to stamp its character upon the visitor. This is not the case when one sees a single flower surrounded by a hundred others of as many varieties. The park is about seven minutes' walk from South Bermondsey Station on the L. B. & S. C. Railway, and the collection is well worth a visit.

(To be continued.)

SOPHRO-CATTLEYA LÆTA.

Our illustration (fig. 63, p. 477), represents the new and extremely pretty Sophro-Cattleya læta, shown by Messrs. Jas. Veitch & Sons before the Royal Horticultural Society, at the Drill Hall, on the 9th inst. As stated in our report of the above meeting, the hybrid is from Sophronitis grandiflora ♂, and Lælia pumila Dayana ♀. The sepals and petals are pale red-pink, the base of the lip white, and the front of a shade of rose. It is something like Sophro-Cattleya × Batemaniana in form, and more nearly like that of S. grandiflora than the seed-bearer.

HOME CORRESPONDENCE.

NOTES ON ORCHID CULTIVATION.—As a constant reader of the *Gardeners' Chronicle*, it gives me pleasure to write a line or two about the treatment of the different species of Orchid at various seasons. Take first the Dendrobium section. Of all—D. Phalænopsis Schroderiana, D. bigibbum superbiens, which have grown better this season in the full sun than when imported, and furnished with grand spikes of flowers. The species known as the King of the Dendrobes, and the Elephant Moth Dendrobe, is, without doubt, the grandest of all autumn-blooming Orchids, and as regards the variation in their colours, I am bold to say, if you wish to see a good display, it is worth while for any Orchid cultivator to go and see them. Another thing I must mention—ours have been grown in much less heat than ever before; in fact, we have grown them in the Cattleya house, where the temperature goes down to 60°. In my collection we have almost a pure white one, except just one mark on the lip, which you can scarcely see; such a grand sound bloom. I have one just like that one the *Gardeners' Chronicle* represented last season out in bloom. This beautiful Dendrobium Phalænopsis Schroderianum will make a good display for such a long time, and is also most useful for cutting purposes; when the spikes show they require a little more heat. I have two grand specimens of Dendrobium nobile which were put out into a span-frame in June; the bulbs then measuring from 25 to 30 inches in length, good stout ones. When taking them into a cool house on September 1, to my surprise I found them to be covered with buds, which fact is an indication that this section of Dendrobiums does not require so much shading as Orchid growers usually afford them. My method of cultivating Dendrobiums of various sections is to afford them full sun and plenty of air. Take, for instance, a few of the crosses of Dendrobium nobile, viz., nobilius, Cooksoni, and D. Leechianum, D. Ainsworthianum, or D. Ainsworthianum roseum, D. Linawianum, D. Findleyanum, D. Dominianum, D. Cypheri var., D. Wardianum Lowii, D. Parishii, D. fimbriatum oculatum, D. Dalhousieanum, and many other species which have made grand bulbs, and are the pictures of health; in fact, D. Dalhousieanum is growing several new pseudobulbs measuring now 3 feet 8 inches in length, and are better than when

imported. The Cattleyas do not like so much sunshine, although mine were not shaded all through the month of September, but plenty of air was afforded them. Lælias will stand plenty of sunshine, especially the varieties Lælia anceps, L. a. alba, L. a Dawsoni, Stella, L. Williamsii, L. Gouldiana, and L. albida autumnalis atrorubens. All these varieties and species have been grown in a frame this season in the full sun, and were put into the Cattleya-house the last week in August. They are making grand growths, and looking full of promise for a good supply of blooms later on; in fact, many of them are showing flower-spikes now. Odontoglossum grande, grown in the full sun this season, in vigorous health, and throwing its spikes of flower. The Odontoglossums have not been shaded half so much as usual this year. Odontoglossum Alexandræ and hybrids are throwing up grand spikes of flowers, also plenty of them; the leaves are a nice dark tint. About Lælia grandis: the best way to successfully deal with L. tenebrosa is to give it a good rest in a cool Dendrobium-house, but start it in heat, with which treatment it flowers and grows most satisfactorily. *C. Sims, Gardener, Brierley Hill, Staffordshire.*

TREES AND SHRUBS NOT COMMON IN GARDENS.—I had a most enjoyable walk lately over the extensive nurseries of Messrs. Robert Veitch & Sons, in the cathedral city of Exeter, and devoted my attention to their enormous collection of trees and shrubs, amongst which are some very uncommon species and many most interesting varieties. It being now near planting time, the following list of what I saw growing there, which contains only those kinds which are not usually met with in gardens, may be of use to arboriculturits in many parts of Great Britain. Doubless, some of them would only survive our winters in the south-western counties, or along the south coast of England. Nevertheless, having flowered Buddleya globosa for eight years at Tonbridge, and remembering a plant of Eriobotrya japonica which lived for seven years out-of-doors and grew 12 feet high near Canterbury, I am strongly of opinion that "warm corners" for many lovely plants could be found outside of Devonshire and Cornwall, which are now rarely seen in other parts of England:—

Abelia uniflora
Abutilon vitifolium
Acacia angustifolia
Arbutus canariensis
,, microphylla
Buddlea Lindleyana
Clematis crispa (crimson externally; white, margined with pink internally)
Cistus capitatus
,, nigricans
,, purpurascens
,, tinctorum
Caryopteris mastacanthus (leaves opposite, flowers pale blue, clusters of them sessile in the axils)
Carpenteria californica
Caragana argentea
Choisya ternata (flowered three times in 1893 near Truro)
Desmodium penduliflorum
Erythrina crista-galli
Escallonia Phillipiana
,, sanguinea
,, rubra
Escallonia littoralis
Eucryphia pinnatifolia
Fremontia californica
Genista Andréana
Garrya Thureti
Hypericum prolificum
,, aureum
Hymenanthera crassifolia
Idesia polycarpa (tree, leaves large, cordate, pointed, bright green, leaf-stalks scarlet)
Ilex Cunninghami
Indigofera Dosua
Olearia stellulata
Osmanthus latifolia
Swammerdamia antennaria
Sorbus macrophylla rotundifolia
Sambucus canadensis laciniata
Satureia diffusa
Tasmania aromatica
Tilia euchloris (leaves very large)
Weigela P. Duchartre (flowers nearly black)
,, nivea

W. T., Hea Moor.

ENCOURAGEMENT FOR COTTAGERS.—I have often thought that if two or three gardeners would co-operate and undertake to visit, during the evening, all the cottage gardens in their neighbourhood, advising and showing the cottagers how the more important operations in gardening, such as pruning, budding, &c., which is so often a failure with them, should be performed, it would encourage them in pursuing gardening as a profitable art. It would be interesting to know what readers of these few remarks have to say on the subject. *C. E. L.* [This is just what is being done under the auspices of some of the Technical Education Committees. Ed.]

RUDBECKIA NEWMANII.—I agree with all that your correspondent, "J.", says about this first-rate herbaceous perennial plant, but here I find it suffers quickly in dry weather, and a few sunny days, even after copious rain, are sufficient to make the leaves flag; and if the plant be not afforded water, or the weather should keep dry, the development of the flower-stems and flowers is checked. At the present time this species makes a fine display in a border here planted alternately with Aster Amellus bessarabicus. *E. M.*

HEDGES IN CORNWALL.—The great similarity of the hedges used in Cornwall to those used in the Holy Land, induces me to copy the account of them given by the Rev. James Neil in *Palestine Explored.* "Throughout Palestine, gardens, orchards, and vineyards, are always enclosed, and the fence employed in almost every instance is the common enclosure wall of the country, called a *jĕdar.* This rude and primitive construction is formed of rough, shapeless, unhewn stones of all sizes. Long practice has made the people very skilful in making *jĕdars;* and the hard marble-like *mizzey* rock, which crops up to the surface in every part of the country, affords them abundant and excellent material for this purpose. The ground is first smoothed, and the stones are then piled up, about 3 feet in width at the bottom, and gradually narrowing towards the top. No mortar of any kind is employed, the stones being merely laid so as to fit closely together. The height varies in ordinary cases from 4 to 6 feet; sometimes they are carried up as high as 12 feet. The whole construction is of course comparatively fragile, though readily repaired at a slight expense without the use of any fresh materials." By the substitution of granite for mizzey, you get in this extract an exact account of most of the boundary fences in Cornwall. Those used for fields and for some gardens are slightly different, in that they are wider at the base, and soil or turf is laid on the top where they are 1 to 3 feet wide. In fields here, nothing is planted at the top, but wind and birds soon provide material for a true hedge of White Thorn, Black Thorn, and other shrubs;

Fig. 63.—Sophro-Cattleya × Batemaniana.

(see p. 476.)

while Blackberries, Potentilla reptans, Hieracium umbellatum, pink and white Milfoils, and numerous other perennials clothe the sides of the walls after a few years, probably growing at first on the top. Similar walls around gardens are planted with Fuchsia, Escallonia macrantha, or Rhododendron ponticum, all of which make beautiful hedge-rows. Roses also are similarly used. Some of the enclosures for old gardens have the base 12 feet or more wide. Upon the top of the wall surrounding two sides of my garden there are Beech and Plane trees 40 feet high, Hollies 25 feet, Fuchsias, Escallonias, and Rhododendrons from 4 to 9 feet high, and several other shrubs. The top of this wall is 10 feet wide. *W. T., Hea Moore.*

THUYA GIGANTEA.—I beg to send you some sprays of Thuya gigantea, with seed, from a tree standing in the grounds at this place, and I should be glad if you could verify it as being the true T. gigantea [yes]. The tree is over 45 feet in height, and is 4 feet 6 inches in circumference round the bole at 3 feet from the ground. Considering that the true Thuya gigantea was only introduced by seed into this country in 1854, I think our specimen a good one. I may add that the tree is covered this season with seed to the very top, like the enclosed sprays show. I think it would be interesting to know where are the finest specimens of T. gigantea, and their dimensions. *G. H. A., Beningborough, York.* [At Orton, near Peterboro', Mr. Harding informs us there is a tree of this species 60 feet high. Ed.]

THE PROPOSED NATIONAL VEGETABLE EXHIBITION.—Will you kindly favour me with a little space in the columns of the *Gardeners' Chronicle* to return thanks to yourself and all of my many correspondents, readers of your paper, who have so readily replied to the circular with respect to the above-named object. Probably few similar suggestions have met with so hearty a response, one that may be practically regarded as unanimous. Almost everyone says, "Such a great exhibition of vegetables should be held, and we wish to render the proposal every help and assistance." That fact shows that there has grown up in horticulture during the past few years a much higher appreciation for vegetables than formerly existed, when no one was proud of his Cabbages and Potatos, but only of his Peaches, Grapes, or Pines. It is somehow now found not to be so terribly difficult to grow these and other fruits, whilst a severe test of a gardener's capacity is permitted in the appearance of his vegetable products. Thus it would seem as if we are better understanding the value of the kitchen-garden products. At the meeting held on Sept. 29 at the Crystal Palace, a small provisional committee, with Mr. H. Balderson, of Hemel Hempstead, as treasurer, and myself as secretary, was formed to carry out the needful preliminary arrangements. That committee will meet on Tuesday next, Oct. 23, and no doubt will prepare a rough kind of outline of what it is desired to do. I shall there report result of circular inviting a wide representative body of horticulturists in the country to give their names as members of a general committee, a somewhat new practice in matters of this kind, and I have no doubt whatever of being able to state that of the replies, there will be 80 per cent. favourable, a very remarkable result, and that of these some 96 per cent. will be entirely favourable. Indeed, I may say that none are otherwise, only one or two favour another course. What that course is I need not refer to here. The next thing to do will be to summon a meeting in London of the whole of the general committee, and it will be for that body to determine what sort and shape the proposed exhibition shall assume, and under what sort of control. I may remind those who have doubts, that the greatest horticultural show of the century, that of 1866, was carried out by an independent committee. That was a grand success. The old Potato shows were so also. The Rose, Dahlia, Chrysanthemum, and other committees or societies are practically independent bodies, organising their own shows, and doing them wonderfully well. Still, help and encouragement, and patronage from every quarter will be, I have no doubt, heartily welcomed. When any body, however commanding, admits that it is impossible for them to do what is desired, there can be no just cause for complaint if others undertake to fill the void. Anything which tends to the welfare of horticulture, provided there be about it no personal or trade aims, no grinding of petty axes, merits the hearty support, help, and sustenance of all who garden, let them be who they may. It is in that spirit this great national vegetable exhibition is proposed, and it is in that high and generous spirit, I trust, it may find national support. Any who have not received circulars, and wish to be members of the general committee, should send in their names at once. They who hesitate are lost. *A. Dean, Kingston-on-Thames.*

THE FRUIT PACKING COMPETITION AT THE CRYSTAL PALACE.—When I read the remarks made upon me by two of your correspondents last week with respect to the above subject, I felt very much as Joe Miller's Jew, who, when about to partake of the forbidden rasher of bacon, was interrupted by a terrific clap of thunder. "Good Heavens!" he exclaimed, "what a row about a bit of bacon." Really, I had to turn to the preceding week's *Gardeners' Chronicle* to see what it was all about, and surprised at the outbreak, I was more surprised, still when I found on what a slender foundation it was based. What did I say about this fruit packing? First, "that I was disappointed." That was so. There was nothing new in what was seen, and some that was indifferent. I have not only seen, but closely observed and criticised all the fruit-packing competitions that have taken place during the past twenty years at South Kensington, Chiswick, and elsewhere, and now at the Crystal Palace, and I hesitate not to say that I have in previous years seen not only far superior average packing, but some better. I have the 1st prize basket of Grapes at the Crystal Palace flung in my face [!] I made no remarks whatever about the Grapes; but the competition in that class was poor. I did not say

that Mr. Woodward's or anyone else's were not well packed, and the assumption is unjust. But where I said Peaches showed nothing new, I was very lenient, because I remember the superb samples of packed Peaches in soft fresh moss that Mr. Coleman, another of his pupils, used to exhibit at South Kensington; and I have never yet seen better packing. Therefore my words were just. I naturally looked for something new and fresh in other directions. Pears came into the same category; they were little indeed, or no better, than what we have seen before, and, perhaps, no worse; but still there was nothing new. If these competitions elicit nothing new or improved, they are of little value. There was a poor competition, in ordinary bushel and half-bushel baskets. There was only one competitor, and that far away behind the packing of such growers as Mr. G. Walker, of Ham. I will not be deprived of my right of independent criticism because others do not properly read their *Gardeners' Chronicle*. *A. D.*

NURSERY NOTES.

FRUIT TREES AT MESSRS. JOHN LAING AND SONS', FOREST HILL.

To many readers this firm may be known solely by the good work it has accomplished—and is accomplishing—with regard to the tuberous Begonia. The recent great hardy fruit exhibition at the Crystal Palace, where Messrs. Laing staged a very fine collection of Apples and Pears (some 137 varieties) was sufficient evidence, however, that efforts are also being very successfully made by the firm in quite another direction of horticultural work.

A call prior to the show just mentioned, to see the fruit *in situ*, revealed much of interest and utility to those of a pomological turn of mind. The fruit nurseries, of some 30 acres in extent, are situated at Rutland Park, Bellingham, and The Farm. The collections were found to include all the best sorts; the stocks, moreover, are exceptionally clean and healthy, and true to name—the latter a very important qualification.

As to "stocks," the suitability of the Quince for Pears, and the Paradise for Apples for garden culture, is amply illustrated here, the stocks in question producing masses of roots near the surface, thus ensuring all the benefits of the sun's warmth, the stimulating action from mulching and watering producing plentifully fine fruit for table or exhibition.

The trees have made a good growth this year, which is attributable to the hot summer of last season thoroughly ripening the trees. Another advantage gained, too, was that the soil was left warm, thus encouraging the production of a quantity of fibrous roots—one of the essential qualifications in successful fruit culture.

Another point of practical importance to cultivators well worth referring to, is the fact that not one tree was pruned in winter—all were summer pinched. This would seem to be a point of special importance, and one which seems to be very much overlooked by those, for instance, who grow their trees within restricted areas, and subject them to much pruning. It may be mentioned that the soil is a light yellow sandy loam, in a splendid piece of maiden land.

Apples.—In a season notorious for the general scarcity of Apples, one noted abundant crops on the sturdy young two and three-year bush-trees. They were a sight, these little 2½ to 3 feet-high trees, loaded with fine fruit, and in the matter of the generally destructive frost on May 21 last, it "went over them," as Mr. Wakelin, Messrs. Laing's manager naively put it, the bigger (taller) trees being comparative failures. The Apple that stood out, so to speak, from all the others by its cropping qualities, and truly fine size, was Bismarck (one particular fruit noticed was about 2 lb. in weight!), its large, flat, dark, red-flushed fruits, were very observable by the visitor in the numerous quarters devoted to Apples. We have never seen in finer condition that very handsome, but otherwise not particularly good, Apple Hoary Morning, with its characteristic dense grey bloom. A fine early kind, and a great bearer, is Duchess' Favourite, sometimes known as Duchess of Gloucester, with a smallish round fruit, and, as seen here, intensely red. The conical Gascoigne's Scarlet was also very noticeable, while Scarlet Crofton is a first quality yellow Russet Apple-flushed.

Amongst other good coloured Apples noted may be mentioned Worcester Pearmain, Lady Sudeley, that very fine and handsome sort, and Scarlet Nonpareil. A great favourite, and of first quality, is Margel, streaked dark red, a firm and well-flavoured fruit; the tender-fleshed Cox's Pomona is red-flushed and streaked; whilst a richly deserved meed of praise must be given to the ever-popular Cox's Orange Pippin, round, yellow, streaked red, and russety. Red Bietingheimer is a large, slightly conical fruit, a handsome German Apple, with a carmine-flush on the sunny-side, a valuable and newish variety. Wealthy and Colonel Vaughan are also well-coloured Apples.

This all too brief reference to some of the higher-coloured Apples may fitly terminate by a reference to the old Sops-in-Wine. We seldom see it now, the last time the writer saw it was at the Great Apple Congress in 1883, when it was noticeable by reason of its small round, angular, scarlet fruits, which are covered by a thick bloom, flesh streaked red; an early and pretty Apple. Amongst other good Apples observed, may be noted Withington Fillbasket, a very large round angular greenish-yellow fruit, as seen here very fine. Of first quality, and a fine handsome fruit largely grown, is Loddington Seedling, a large pale green, flushed fruit; as also the first-rate pale yellow Pott's Seedling, Lord Grosvenor, Lord Suffield, Washington, a very handsome conical Peach-like kind, but succeeding best on a wall or orchard-house, when its melting flesh of excellent flavour is much esteemed. Emperor Alexander, very fine; Bramley's Seedling in grand condition; Stirling Castle, Gold Medal, Lord Derby, Warner's King, The Queen, Schoolmaster, Lane's Prince Albert, Peasgood's Nonsuch, exceptionally fine; Golden Spire, branches literally laden with fine fruits; Waltham Abbey Seedling, Gravenstein, that valuable newish kind Newton Wonder, Gloria Mundi of extra size, Wellington, Hanwell Souring. A newish fruit is Beauty of Stoke, large, somewhat conical, of a uniform brown-russety appearance, and very heavy, quality excellent, a good bearer on pyramids or standards. The Hawthornden types, old, new (winter), or silver and red, were observed in excellent condition, being grown in large quantities. An Irish early Apple called Gibson's Russet, is worth noting, something in the way of Syke House Russet, but larger. It may be added, before leaving this section, that not only have the firm a fine stock of these bush and pyramid trees, but of fine standards on straight, clean, healthy stems, and wanting no stakes to support them. Horizontal-trained trees are quite worthy of a passing reference, as are the cordons in both Apples and Pears. This style of tree is advantageous, doubtless, for covering walls and similar spaces in small gardens in the neighbourhood of towns, affording early and paying crops of fruit.

In an orchard-house we noted a fine lot of established pot-trees for this system of culture in all the leading kinds—kitchen and dessert. And in the same structure was a fine lot of late Peaches in pots, of such sorts as Lady Palmerston, Sea Eagle, late Admirable, Weatland (new), and the very large Salway with yellow melting flesh. A new Pear, named Le Lectier, was noted here. It is a dessert kind—a good cropper—season, November to January. Another newish dessert Pear observed was President Drouard, season, November and December. A fine lot of fruiting-trees in pots (in var.) for cool orchard-house culture (a certain mode of growing large fruit), was noted.

Pears:—In the outside quarters—as may be expected—a good stock of this popular fruit is grown, the trees bearing most freely in all shapes, standards, half-standards, pyramids, dwarf fan-trained, for walls, or espaliers, horizontal trained for the same purposes, bush trees and cordons, single, upright, and diagonal. As to the Quince stock, a strong rich loam suits it best, whilst a lighter soil suits the free stock for Pears. The main advantage of growing Pears on the Quince as a stock is for early fruiting purposes, and producing fine fruit, whereas the generally accepted axiom respecting Pears grafted on the free or Pear stock is, that—

"He who plants Pears,
Plants for his heirs."

Pear culture sometimes fails because the roots are not properly pruned and regulated, a matter of the greatest moment in any fruit cultivation. The roots should always be kept near the surface, except upon sandy soils, and root-pruning must be vigorously carried out in October. To refer to a few varieties of Pears (amongst the many) noted in our visit: a very large and handsome October Pear, with bright red cheek, making a fine cordon, is Beurré de Mortillet (new); Triomphe de Vienne, a newish variety of great excellence, large, pyriform, and of good quality. Magnate is a very large pyriform fruit, yellow and dark crimson skin, handsome, juicy, and hardy, much stronger than its parent, Louise Bonne of Jersey, of which rich, deliciously-flavoured Pear some fine examples were noted. Very large and handsome is Durondeau, large, obtuse, juicy, and sweet. Beacon was over at the time of our visit, but it is worth a note as a bright and handsome prolific fruit, proving a desirable kind for its season (August). A variety of great excellence from America is Clapp's Favourite, somewhat in the way of Windsor in shape. Brockworth Park is a fine exhibition variety. The newish Conference is a large juicy Pear. Fertility is rightly named, bearing a very large crop of rich and juicy medium-sized fruits. Duchesse de Mouchy is a new variety, about which more will doubtless be heard. Succeeding well as a standard is Beurré Alexandre Lucas, fruits above medium size, flesh tender and juicy, a strong grower, attaining a large size. Somewhat new is the Belle d'Ecully (Prénices d'Ecully), a prolific bearer, fruits very large, tender, melting, and very juicy; it forms a medium-sized pyramid, bearing well on cordons. Emile d'Heyst is above medium size, flesh melting and sugary, one of the best of autumn Pears, does well on the Quince, bearing most freely, and is useful for orchard cultivation. That very large, melting Pear, Souvenir du Congrès (seedling from Williams' Bon Chrétien) was over, but worth a note as forming a medium-sized pyramid, a good cordon on the Quince, and being very good against the wall. Hacon's Incomparable is medium, roundish, sweet, rich; making a prolific and handsome tree on the Quince, but does not always bear well on the Pear stock. Knight's Monarch is a very valuable and well-known kind. It is a variety which has the habit of casting its fruit; it should not therefore be heavily thinned. The tree makes a handsome pyramid, bearing well. The splendid Doyenné du Comice, one of the finest Pears known, bears remarkably large fruit on the Quince, and forms a fertile cordon or wall-tree. Beurré Fouqueray is a fine and handsome new Pear of French origin, hardy, bearing very freely, particularly when grown as a pyramid on the Quince. One of the best late-keeping sorts is Marie Benoist, large Bergamotte-shaped, with a brisk perfumed flavour making a good cordon or small pyramid on the Quince. Forming as a fine tree on the Quince when pyramid trained or cordon, is Olivier de Serres, a delicious russety fruit of handsome Apple-like appearance, the best flavoured in its season (February to March). Another good late Pear, worthy of general cultivation, is Josephine de Malines, which does well on Quince or in any other form, bears freely, and is invaluable on account of its extended season. Madame Chandy (new) is a large pyriform fruit, flesh fine, melting.

A Pear that has very few equals in its season (October to November) is Belle Julie; a medium-sized fruit, flesh yellowish, buttery, and very juicy; extremely prolific, and succeeding well as a pyramid or cordon. La France is a new French sort that may be more spoken about later. General Todtleben is a good late Pear, large, pyriform, melting, and rich, forming a beautiful pyramid, and growing well on

the Quince. And then we might refer to such fine varieties as Marie Louise, Marie Louise d'Uccle, Beurré Superfin, Easter Beurré, B. Diel, B. d'Amanlis, B. Clairgeau, Duchesse d'Angoulême, Pitmaston Duchess, and a host of other good sorts grown here, did space permit.

Lengthy fruit-borders, planted only last March, having cordon Apples on each side, backed by Pyramid Apples, Pears, and Plums, have made very satisfactory progress this season, several trees bearing fruit.

In referring earlier in these notes to the Apples, I omitted to note that a good quarter of cordon Apples, transplanted last March, has produced fine crops the first season.

To refer, by way of bringing these somewhat lengthy notes to a conclusion, to a few other specialties:—Plums are grown in all the leading varieties, dwarf-trained, horizontal, cordons, pyramids, and standards. Some of the dwarf-trained stuff made shoots this season 8 feet to 10 feet in length, showing the capabilities of the trees. In Peaches and Nectarines, a fine lot of trained trees were noted—dwarfs, standards, and half-standards. Some two-year-old trees of Peaches and Nectarines, fan-shaped, are fine healthy stuff, forming splendid fruiting wood.

Cherries, too, in all shapes for training or otherwise, are a fine stock; and the cordons, pyramids and standards were noteworthy. Trained Apricots, extra fine fruiting trees, are quite worthy of record, as are the fruiting trees in pots for orchard-house culture, and among the latter may be noted the firm's fine Fig trees in pots. Those useful bush fruits, Currants and Gooseberries are represented by all the best kinds in thriving condition. The firm are sending out a new Strawberry named George Rundle, an improvement on the well-known British Queen. Fruit and colour like British Queen, light red, large size, often weighing more than an ounce, strong grower, distinct dark green foliage. Fruits freely. *Visitor.*

New Invention.

THE SPRINGTHORPE CUP AND TUBE.

This is another form of the telescopic flower-tube intended for the use of exhibitors of Roses, Chrysanthemums, Asters, Dahlias, and flowers generally which, by reason of their weight, are apt to droop their heads, an undesirable attitude for an exhibition bloom. The tubes can be drawn apart separately, and are kept at any desired height up to 7 inches by means of brass springs soldered on to them. It is simplicity itself, and perhaps has an advantage over those which are regulated by moving a tube formed with a spiral thread, seeing that an alteration may be made in height without having to twist or turn the flower about when it is in its place on the show-stand. The patent is provisionally protected.

ROYAL HORTICULTURAL.

Lecture on Popularising Orchids.

October 9.—In the afternoon a paper on "How to Popularise Orchids," was read by Mr. E. H. Woodall, of Scarborough, who commenced by remarking that in order to insure success, one of the first things required was observation. If a gardener used himself to this, a few days would suffice to perceive whether or not a position or treatment accorded a plant was that suited to it or not. If Orchids are to be grown by the million, including those with only meagre house accommodation, it is desirable that a knowledge of the essential requirements of the plants should be more common than at present. He had proved in his own garden, that with one house only, and a frame, it was possible to grow a good number of Orchids, and to obtain considerable pleasure from them. It is desirable that nurserymen should describe the habitats of the plants they collect, give particulars as to climate, temperature, elevation, humidity, &c. If this were done, and cultivators would endeavour to provide similar treatment to that the different species enjoy naturally, it would prevent much of the wicked waste that occurs through tearing these jewels from their native place, and bringing them here, where at present so large a percentage dies.

Cool Orchids have been so successfully grown by the trade and by other large growers, that it is common to see long houses devoted to them, and the impression obtained that without such houses at command it is impossible to succeed with them. Many of them, however, could be grown well by amateurs who have only one ordinary greenhouse and a cold frame. When the lecturer commenced to grow Orchids, he placed them in a rather close and stuffy fernery facing north, but was soon aware that such conditions were adverse to their well-being. He excavated to a depth of about 18 inches under a north wall, and concreted the bottom, which he covered with water. Over this was put a frame, and the plants were stood on pots over the water.

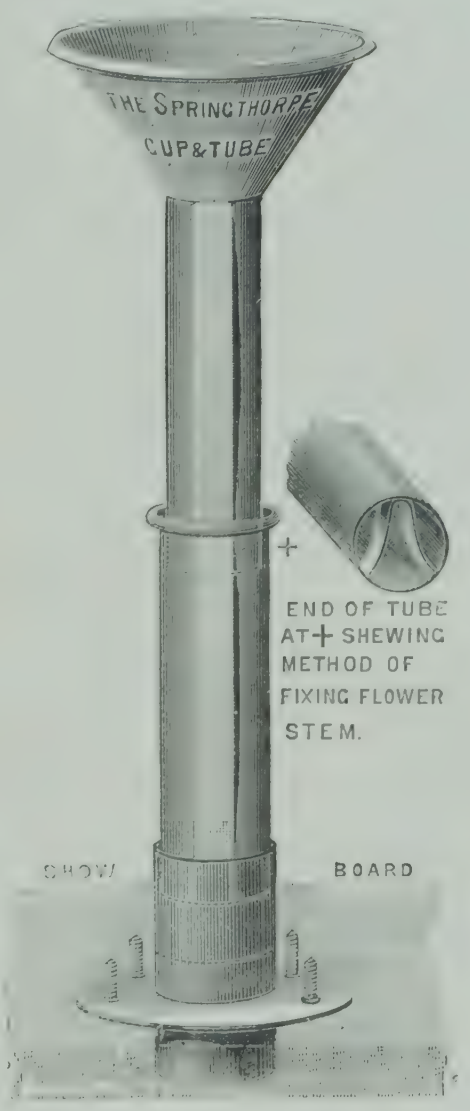

Fig. 64.—THE SPRINGTHORPE CUP AND TUBE.

Many of the cool or equatorial Orchids, as the lecturer preferred to call them, came from close damp woods where there was but little winter or summer, as we know such seasons, and to imitate this as far as possible, the lights were taken off entirely during dewy or wet days, but during dry ones they were closed, and at night if there was dew or rain the lights were taken off. Into this frame the plants were put in the late days of spring, and at the end of September when they were removed from the frame, they had enjoyed the conditions so much that they had recovered themselves greatly and had made abundance of roots. When removed from here, they were placed in an eastern aspect in the greenhouse, and each stood over a saucer of water. The plants fared very well in this position until March, when they required to have canvas screens to protect them from the sun, then beginning to obtain power. Afterwards, when they were put out again into the frame, the plants grew away at once, and in September were remarkable specimens, most of them having in their strong, new growths, healthy flower-spikes. The system had proved successful, and remarkably so, since which time Mr. Woodall had pursued it with unbroken success, excepting during the season 1893, when the hot, dry weather, without any rain during the hottest period of the year, made it exceedingly difficult to keep the plants cool and moist. The idea was to keep the plants as cool as possible and moist during our summer, and they were then better able to withstand the winter; and it should be remembered that, in their native homes, they had neither summer nor winter, but were always moist, always cool. Some of the species he had found especially amenable to such treatment—greenhouse and frame only—were Odontoglossum crispum, O. Pescatorei, O. hebraicum, O. triumphans, O. Rossi majus, and others. Others that enjoy the frame treatment well, but require a slightly warmer place than the cold greenhouse during winter, are Odontoglossum grande and Epidendrum vitellinum. Slight modifications were then described which had been found necessary for other species, many of which only wanted special treatment during part of the season.

Mr. Douglas, who occupied the chair, made a few remarks, as illustrating the serious mistakes the Orchid-grower may make before he becomes acquainted with the exact method of culture required by this or that plant.

Obituary.

H. W. Lewin.—We much regret to record the decease on the 9th inst., of Mr. H. W. Lewin, a gardener of the highest ability, who for about forty years had managed the extensive gardens of Sir D. C. Buchanan, Bart., at Drumpellier, Coatbridge, N.B. Mr. Lewin excelled in every branch of his business, and he was possessed of great energy and refined taste; consequently it was always a great pleasure to the horticulturist to visit the gardens at Drumpellier. We may mention the fact that for some thirteen years in succession he secured the first prize for Cyclamens at the shows of the Glasgow and West of Scotland Horticultural Society. The deceased gardener's earlier years were spent at Kew, Maresfield Park, Sussex, and Lonsdale House, from whence he removed to Drumpellier. A widow and one son survive him.

Edward Spivey.—We are requested to announce the death of Mr. Edward Spivey, which took place at Sawbridgeworth on the 2nd inst. The deceased, who was eighty years of age, was for nearly half a century head gardener to the late J. A. Houblon, Esq., Great Hallingbury Place, Bishop's Stortford, and was well known as a gardener of the old school. He was for many years a contributor to this journal, and at one time a large exhibitor of fruit at the London and other shows.

John Edmondson.—The seed trade generally, and that of Ireland in particular, will learn with regret, of the recent death of Mr. John Edmondson, the head of Messrs. Edmondson Bros., Seed merchants, 10, Dame Street, Dublin, at the age of 71 years. He was a native of Lancashire, and was born at Penketh, Lancashire, in the year 1823. His father was schoolmaster of the place, and a member of the Society of Friends, with which the late Mr. John Edmondson was associated. His early education was gained at his father's school; later on he attended that of his uncle, Mr. George Edmondson, afterwards Principal of Queenwood College, near Romsey, in Hampshire. For some years, while quite a youth, he was associated in business with his uncle, Mr. Thomas Edmondson, the inventor of the Railway Ticket System now in use. In 1846 he was sent over to Ireland to introduce the system on the Great Southern and Western Railway, which was then about to be opened, and in 1850 he paid a visit to America in connection with the Railway Ticket business. In 1851, having relinquished his connection with his uncle, he settled in Dublin, and established himself as a seedsman, trading as John Edmondson & Co., at 61, Dame Street. Eventually the firm took the title of Edmondson Bros., at 10, Dame Street, where it is now located. Garden and agricultural seeds are supplied on a large scale,

and a good business is down with implements. Here the firm will be continued under the title of Edmondson Bros. It may be stated that they are the Dublin agents for Messrs. Thomas Rivers & Sons, Sawbridgeworth. When in Dublin in 1869, I had the pleasure of making the acquaintance of Mr. John Edmondson, visiting him at his private residence near the city. His kindly disposition charmed all, and the consideration with which I was treated, going to Ireland as a stranger, made a deep impression upon me. His brother, Mr. Thomas Edmondson, started, in 1869, *The Irish Gardeners' Record*, and continued it for some years, but failed to establish it for lack of support from those whom it was particularly desired to benefit. *R. D.*

TRADE NOTICES.

Messrs. Dobbie & Co., Seed Merchants and Florists to the Queen, Rothesay, have just arranged for a lease of the Chelsfield Estate Farm, Orpington, Kent. This farm is finely situated, 13 miles south of London, and is intersected by the main line of the South Eastern Railway. It is about 60 acres in extent, and will be used by Messrs. Dobbie entirely for seed-growing purposes.

Messrs. W. L. Lewis & Co., of Chaseside, Southgate, London, N., desire to announce the fact that they have admitted Mr. F. W. Ashton, sometime their representative, as a partner in their firm. The business will be conducted under the same style as heretofore.

LAW NOTES.

A HORTICULTURAL SOCIETY AND PRIZE MONEY.

An action which aroused considerable interest among local horticulturists was heard at Warwick County Court on Wednesday, the 10th inst. Wm. Robbins, gardener, of 17, Rugby Road, Leamington, sued Henry Parker, Hon. Sec. to the Milverton Horticultural and Industrial Society, for payment of 14*s.* 6*d.*, being amount of money prizes awarded at the recent annual show of the Society. Mr. Crowther Davies appeared for the plaintiff, and Mr. A. E. Overell for the defendant. Plaintiff said the exhibits for which he gained the prizes were genuine, fair, and honest, in accordance with the rules of the Society. They were all grown on his own allotment. Mr. Overell submitted that the case was beyond the jurisdiction of the court, on the ground that the Society's rules claimed final judgment in all cases of dispute. His Honour, however, overruled the objection. Mr. Overell: Do you know that the small committee was formed for the purpose of visiting these allotments? Yes.—And were you told on the day of the show that the committee had reported against you? I was told after the judges had awarded the prizes to me that the committee wanted to see me in the tents.—And what did they tell you? The Chairman said I had not grown the stuff I exhibited; he said I had not got room to grow them in my garden, and I had not got more than three rows of Potatos.—And the judges disqualified you? The committeemen disqualified me.—And the judges assented? They were not there.—Did you not afterwards meet a Mr. Pratt, and say to him, "You are a fine fellow to speak to a man as is out of work?" I don't recollect.—A garden needs to be kept in good order to produce show exhibits. It requires a good deal of attention.—Weren't there some weeds in your garden? Yes; it was rather weedy.—Some of the weeds were almost as high as the Peas themselves? Mr. Davies: We didn't show any weeds.

A number of witnesses were called in support of the plaintiff's case. Witnesses were also called by the defendant, and these stated that the condition of the plaintiff's garden at the time of the show precluded the idea of him having grown what he had exhibited.

His Honour said it rested with the defence to make a case out, because the prizes were actually awarded. The evidence was very conflicting, and he could not say he had no doubts in his own mind. At the same time, he was not satisfied that the plaintiff did not grow the vegetables, and he should, therefore, give judgment for the plaintiff; but the small amount of the claim did not carry costs.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending October 13, is furnished from the Meteorological Office:—

"The *weather* during this week was very dull over our Islands generally, with a good deal of wet mist and fog. A little rain fell at nearly all stations during the middle part of the period, and again in the north and east towards its close. A thunderstorm was experienced, locally, at Wisbech on the 7th, and heavy rain fell on the same day at Strathfield, Turgiss.

"The *temperature* exceeded the mean in all districts, the excess varying from 2° in 'England, E. and the Channel Islands,' to 4° in 'Scotland, N.W.,' and many parts of 'England,' and to 5° in 'Ireland, N.' The highest of the maxima were recorded on rather variable dates, and ranged from 68° in 'England, S.W.,' and 67° in 'England, S. and the Channel Islands,' to 61° in 'Scotland, N.' The lowest readings occurred, as a rule, towards the latter part of the week, when the thermometer fell to 29° in 'Scotland, E.,' to 35° in 'Ireland,' and to 36° in 'Scotland, W.,' 'England, S.W.,' and the Midland Counties.' Elsewhere the minima ranged from 37° in 'Scotland, N. and England, N.E.,' to 43° in 'England, N.W.,' and to 45° in the 'Channel Islands.'

"The *rainfall* was less than the mean in all districts, the deficit being considerable.

"The *bright sunshine* was in excess in the 'Channel Islands,' but in all other districts there was a marked deficiency. The percentage of the possible duration ranged from 10 in 'Scotland, W.,' and 11 in 'England, E. and N.W.,' to 25 in 'England, S.W.,' while in the 'Channel Islands,' the percentage was as high as 48."

MARKETS.

COVENT GARDEN, October 18.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Potatos.

In the absence of extra supplies, our markets continue firm, and the opinion of the trade generally is in favour of better prices, based principally upon the estimates for America, although the report per last mail, both New York and Philadelphia, are less encouraging. Prices of last week are fully maintained. *J. B. Thomas.*

SEEDS.

London: *October* 17.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report fair demand for winter Tares at the unusually tempting rates now accepted; values, indeed, have reached quite a holding-over level. Sowing Giant Rye is also exceedingly cheap. New Mustard and Rape seed offer likewise on most moderate terms. There is not much now doing in either Clover or Trefoil seeds; but rather more attention is being given to Alsyke. The colder weather has naturally somewhat improved the trade for boiling Peas and Haricot Beans. Bird seeds continue a slow sale.

FRUITS AND VEGETABLES.

Borough and Spitalfields: *October* 16.—Quotations:—Cabbages, 1*s.* 6*d.* to 3*s.* 6*d.* per tally; Turnips, 1*s.* 6*d.* to 2*s.*; Carrots, 1*s.* to 2*s.*; Parsley, 8*d.* to 1*s.* 6*d.* per dozen bunches; Horseradish, 1*s.* to 1*s.* 6*d.* per bundle; Onions, foreign, 2*s.* to 2*s.* 6*d.* per bag; do., English, 3*s.* 6*d.* to 4*s.* 6*d.* per cwt.; Apples, English, 2*s.* to 6*s.* per bushel; Pears, 9*d.* to 3*s.* 6*d.* per half sieve.

STRATFORD: *October* 16.—The supply to this market during the past week was all that could be wished, and the trade was brisk, there being a large attendance of buyers. Cabbages, 1*s.* 6*d.* to 2*s.* per tally; Savoys, 2*s.* to 3*s.* do.; Greens, 2*s.* to 4*s.* do.; Cauliflowers, 9*d.* to 1*s.* per dozen; do., 3*s.* to 4*s.* per tally; Turnips, 1*s.* 6*d.* to 2*s.* per dozen bunches; Carrots, household, 40*s.* to 50*s.* per ton; do., cattle-feeding, 35*s.* to 40*s.* do.; Parsnips, 9*d.* to 1*s.* per score; Mangels, 12*s.* to 16*s.* per ton; Swedes, 16*s.* to 18*s.* do.; Onions, English, 60*s.* to 70*s.* per ton; do., Dutch, 2*s.* to 2*s.* 6*d.* per bag; Apples, English, 2*s.* to 4*s.* 6*d.* per bushel; do., American, 11*s.* to 13*s.* per barrel; Sprouts, 1*s.* 6*d.* to 1*s.* 9*d.* per half-sieve; Cucumbers, 1*s.* to 1*s.* 6*d.* per dozen; Damsons, 2*s.* 9*d.* to 3*s.* per half-sieve.

FARRINGDON: *October* 17.—Quotations: Parsnips, 50*s.* to 60*s.*; Carrots, 40*s.* to 45*s.* per ton; Celery, 8*s.* to 10*s.* per doz. rolls; Onions, English, 70*s.* per ton; Beetroots, 60*s.* per ton; Cabbages, 2*s.* 6*d.* to 3*s.* per tally; Cauliflowers, 5*d.* to 1*s.* per dozen; Spinach, 1*s.* to 1*s.* 3*d.* per half peck; Cucumbers, 1*s.* to 1*s.* 9*d.* per dozen; Melons, 6*s.* per case of 24; Tomatos, 6*s.* per doz. lb.; Walnuts, Green, 4*s.* per bushel; Grenoble Walnuts, 20*s.* per bag; German do., 10*s.* do.; Grapes, 9*d.* per lb.; Apples, 4*s.* to 5*s.* per bushel; Pears, 3*s.* to 6*s.* do. Horseradish, 1*s.* to 1*s.* 2*d.* per bundle.

POTATOS.

BOROUGH AND SPITALFIELDS: *October* 16.—Quotations ranged from 45*s.* to 85*s.* per ton.

STRATFORD: *October* 16.—Quotations: — Magnums, Dark-land, 45*s.* to 50*s.*; do., Light-land, 50*s.* to 70*s.* per ton.

FARRINGDON: *October* 18.—Quotations: — Bedford's Colossal, 80*s.* to 90*s.*; Triumphs, 90*s.* to 100*s.*; Sutton's Abundance, 70*s.* to 80*s.*; Main Crops, 70*s.* to 80*s.*; Bruces, 60*s.* to 65*s.*; Magnums, 60*s.* to 65*s.* per ton.

LONDON AVERAGES: *October* 17.—Snowdrops, 80*s.* to 90*s.*; Kidneys, 60*s.* to 80*s.*; Magnums, 50*s.* to 70*s.*; Main Crop, 65*s.* to 85*s.*; Hebrons, 70*s.* to 85*s.*; Black-lands, 45*s.* to 55*s.* per ton.

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 75*s.* to 132*s.*; do., inferior, 45*s.* to 128*s.*; hay, best, 60*s.* to 120*s.*; do., specially picked, 130*s.*; do, inferior, 38*s.* to 60*s.*; Mixture, 90*s.* to 120*s.*; and Straw, 22*s.* to 38*s.* per load.

Answers to Correspondents

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** PLANTS, FRUITS, ETC., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six varieties should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

BEGONIA REX VARIETIES: *X. Y. Z.* The upper surface of the leaves was much gnawed by white thrips, of which great numbers were noticed still alive and active. You should use some means to exterminate the insects from these and other plants upon which they are doubtless to be found, before they come into greater activity in the spring. Some of the spraying insecticides would be useful on these Begonias, whose leaves cannot be sponged or dipped without injury to their appearance. The spraying should take place at intervals of a month or less, if the insects are observed. They are not easily got rid of by ordinary fumigation—besides, it does harm to the leaves. Whilst the Begonias are resting, during which time most of the leaves will have dropped, would be a good time to spray or dip them.

BOOKS: *Decorator.* The book to which you allude is out of print. Enquire at the office of the *Bazaar*, 171, Strand, London, W.C.—*S. P. D.* The most suitable for you is Williams' *Manual of Stove and Greenhouse Plants.* Anderson's work is a good one, but it is not up to date.

CATTLEYAS AND LÆLIAS FLOWERING IN THE AUTUMN: *S. W.* Cattleya labiata, C. l. Peacatorei; C. Eldorado, C. bicolor; and Lælia elegans prasiata, L. autumnalis and vars., L. Amanda, L. monophylla, L. Lindleyana, and L. Perrini, and vars.

CEDAR OF LEBANON ON CLAY SOIL: *Cedrus.* The trees would make good growth if the land be drained, and some amelioration of the staple can be effected by mixing with it during the carrying out of the trenching a good quantity of lightening matter, such as sand, gravel, ballast, &c. The stations for the trees ought to be raised 1 foot or more above the surrounding level, and a few dozen nurse plants planted round about, the aspect being exposed to the east. Larch, Spruce, Austrian Fir, Alder, Poplar, &c., would do.

COLD FRAMES FOR WINTER USE: *Richards, Cheshire.* See reply given to "X." at p. 418, of our issue for October 6.

CORRECTION.—In article on "Thinning Forests," p. 401, column 3, line 41, read 1875, not 1873; and in line 77 of same article, after 7 inches read cube.

DAISIES IN LAWN: *M. K. G.* Watson's Lawn-sand is said to destroy them. Spudding is an effectual but a tedious method. Where the mowing-machine is used Daisies increase amazingly, and if the plants are not very numerous in your lawn, letting the grass grow long, and mowing it at intervals of a month or six weeks with the scythe checks seeding. Machine-mowing at short intervals weakens the plants, so that the flower-stalks become very much dwarfed, and many flowers are passed over by the machine, which produce seed in due time. A dressing of guano will help the Grasses to overcome the weeds.

D.ŒC: *Forester.* "Œconomiæ Doctor" is a degree granted by some of the German Universities, such as that of Munich, after study in the Staatswirthschaftlich Facultät. No British University grants any such degree.

EARTH-WORMS: *J. T.* The earth-worms may be brought to the surface by watering the soil with water impregnated by quick-lime, letting the water become clear before it is used. The worms when once at the surface should be gathered up. If on turf, they may be swept or raked up. We do not think that the Lilium auratum bulbs have been killed by the worms, although you have found them at the heart of the bulbs; and the Primroses may have been gnawed just above the ground by slugs, the grubs of weevils, or what not. The worms are quite incapable of gnawing through the stem of a Primrose. The slugs and the weevil larvæ are responsible for much loss of plants in the garden. If slugs abound, treat them to salt and lime, or salt and wood-ashes in the evening at feeding-time; or when frost appears certain, and the ground is still soft, spread litter very thinly about among your plants, and the slugs being fond of shade and shelter, will creep under this, but it being no protection against frost, they will be killed wholesale by the low temperature.

GRAPES: *A. P., Cardiff.* The Grapes are badly shanked, which may be due to a variety of causes, the chief of which are a soured pasty soil, insufficient drainage, denudation of large quantities of leaves and shoots at or about the colouring period, and over-cropping; almost every variety is liable to it in a greater or lesser degree. You yourself will be better able to judge of the cause of your Grapes shanking than we.

INSECTS: *Geo. Abbey.* We were unable to find any in or about the mould you sent with young Cabbage plant. Probably none enclosed, or, if enclosed, then killed, and afterwards undiscernible. —*Eurycles: W. R.* The bulbs are attacked by the grubs of the Narcissus-fly (Merodon); this may give you some clue to the history. There is no connection with any former attack of Eucharis mite. Carefully destroy all infested bulbs, and replant the sound ones in fresh clean earth. *R. McL.*

LILIUM HARRISII: *J. T.* This is properly L. longiflorum, variety Harrisii, and it may be planted at this season in pots or the open ground—it is the proper season to plant bulbs which spoil by being kept out of the soil. They may be kept, however, out of the soil as late as June, if wrapped in clay, and kept cool in the Japanese method. It is best not to allow Lilium auratum to remain in the soil all the winter unless the latter is warm, dry, well drained, and rats do not exist about the place. Take them up and pot them, keeping the soil damp and cool, storing them out of doors in tree leaves with tiles or pieces of slate over the pots, so as to afford no ingress to rats and mice. Do not put so many leaves about the pots as will induce warmth by fermentation, it being only the frost that should be excluded, and exciting warmth in the winter would cause growth, that is, top growth before any roots form.

MONSTERA DELICIOSA: *R. M.* A soil rich in vegetable matter; say leaf mould and peat, with sufficient sand (coarse) to keep it open and prevent rapid souring. Good drainage and large pots or tubs, or a border. Grow in an ordinary hothouse; the plant does not suffer if grown in a shady place, although to ripen the fruits properly it should have direct sunlight. The leaves do not readily burn except under very large panes of glass, and they are very close to them. Keep moderately moist in the winter, and afford plenty of water, and occasionally manure-water whilst actively growing. But unless there is plenty of space for the plant to ramble, the latter should be rarely afforded, and certainly not the first year after planting in fresh soil. The plant looks well if planted at the foot of a stout oaken post or a young Larch tree in the rough, or allowed to run over rockwork. If you would keep the plant of moderate dimensions, grow it in a pot and re-pot biennially. It belongs to the N. O. Aroideæ, and is a native of Jamaica.

NAMES OF FRUITS: *W. N.* 1, Flemish Beauty; 2 Louise Bonne of Jersey; 3, Beurré d'Aremberg.—*F. W. S.* 1, Beurré d'Amanlis; 2, Beurré Superfin; 3, Marie Louise; 4, Beurré d'Aremberg; 5, Not known; 6, Verulam.—*P. M.* Most of the numbers detached from the fruits, having been pinned on—a bad practice. The large long Pear is Uvedale's St. Germain, the large round one Gansell's Bergamot, the reddish-skinned Beurré Clairgeau, small fruit Beurré Diel. No. 3, Brown Beurré.—*G. Davison.* 1, Josephine de Malines; 2, Knight's Monarch; 3, Fondante d'Automne; 4, Beurré Bachelier.—*W. T. Holmes.* 1, Belle de Bruxelles; 2, Louise Bonne of Jersey; 3, Not known.—*W. S. L.* 1, Van Mons. Léon le Clerc; 2, Rotten; 3, Cox's Pomona or Emperor Alexander.—*D. E.* 1, Glou Morçeau; 2, Marie Louise d'Uccle.—*Burghley.* 1, Beurré Superfin; 2 Paradis d'Automne; 3, Apple Alfriston.—*Quintin Read.* 1, Pear Deux Sœurs; 2, Dutch Codlin; 4, Fearn's Pippin: 7, Landsberger Reinette. The others we do not know—not at all familiar to us. *T. A. N.* 1, Beurré Superfin; 2, Beurré Diel; 3, Marie Louise; 4, Louise Bonne of Jersey; 5, Passe Colmar.—*H. O. N.* (Thanks for 5*s.* for Orphan Fund.) 1, Van Mons. Léon le Clerc; 2, Chaumontel; 3, Not known; 4, Pitmaston Duchess; 5, Beurré Rance; 6, Past recognition.—*D. McDougal.* 1, Hoary Morning; 2, Ribston Pippin; 3, Margil; 4, Lemon Pippin.—*Carnarvon.* 1, Duchesse d'Angoulême; 2, Durondeau; 3, 7, Not known; 4, Doyenné Gris; 5 Maréchal de la Cour; 6, Yorkshire Greening.—*R. K.* Your Pear is Pitmaston Duchess.—*Preston.* Pear Virgoleuse, a very old variety, which is shy in fruiting when young, but is fruitful when aged. On warm soils in the south it is usually good, but on cold soils and districts almost worthless.

NAMES OF PLANTS: *E. J. B.* Cratægus punctata.—*J. C. Stogdon.* 1, Peziza aurantiaca; 2, Ticket loose; 3, Phallus impudicus; 4, Lenzites betulina; 6, Polystictus versicolor; 8, Stereum hirsutum; Polyporus betulinus. Two specimens in state of putrefaction could not be named; all badly packed. Each specimen should have been in separate paper. *M. C. Cooke.*—*W. Smith.* Ruellia Portellæ.—*C. J. Bottey.* Cornus mas, the Cornelian Cherry; flowers in very early spring.—*G. H. A.* 1, Thuya gigantea; 2, Cratægus coccinea; 3, a Viburnum; we cannot tell which from the specimen sent.—*J. K.* Juniperus chinensis.—*W. J. P.* 1, probably Pinus Lambertiana; 2, Cassinia fulvida, commonly, but erroneously, called Diplopappus chrysophyllus; 3, Alnus glutinosus var. laciniata; 4, Prumnopitys elegans; 5, Retinospora plumosa, silver variegated; 6, not recognised; send when in flower.—*The Hon. Mrs. F.* The word Dendrobium was a printer's error. Your plant is Saccolabium bigibbum.—*W. T., Cheltenham.* Ceanothus azureus var.—*L. C., Rugby.* The Cattleya, of which you send leaves, is suffering badly from fungous disease. It would be safer to isolate the plant.—*H. M.* Ficus rubiginosa, sometimes grown as F. australis.—*J. B. C.* Sibthorpia europea.—*S. P. D.* Agave americana variegata. The other is a species of Acacia, probably A. inermis.—*C. W.* 1, Prunella grandiflora; 2, Aster Amellus; 3 and 4, forms of Helianthus rigidus; 5, Helenium autumnale; 6, Montbretia crocosmæflora.

Orchid Committee: *Observer.* You are mistaken; the chairman, as is invariably the case, and as we have the best reason for knowing, had left the table before his exhibits were adjudicated upon by the committee.

Orchids at Manchester Botanical Garden: *B. A.* Our correspondent has the right to express his opinion. We cannot enter into the controversy.

Selling Price of Cypripedium Crosses: *S. W.* The prices vary so greatly, that we are unable to give even an approximate figure. Why not apply to someone cognisant with the value of Orchids, showing him the plants, descriptions having not much value in such cases.

Shrivelled Grapes: *Anxious One.* There was no fungus present on the Grapes sent, except superficial forms, which follow decay, and the shrivelling of the fruit must be due to imperfect treatment. Examine the state of the roots near the surface, and also low down in the soil, and send us some for inspection. *G. Massee.*

Smilax (properly Asparagus): *R. M.* The tender species do well in either peat or loam in the intermediate-house. If not required to ramble much, grow them in pots; but they do best planted out. Propagation is by means of suckers. The American fashion of training the shoots is by securing these to pieces of thin twine, stretched on the roof or front of the glasshouse, by which method long shoots can be removed intact. The plant does not require much water at any time.

The Best Grafter of Vines in England: *L. K. S.* The art is not much practised in this country, inarching by approach being the method usually adopted by gardeners. Sometimes the union of green shoots, i.e., in a half-grown state, is obtained by grafting. The method adopted by the continental vineyard cultivators is to take an ordinary bottle cork, split it in half lengthwise, cut out a shallow channel in the middle of each half, make a tongued splice of stock and scion, put the two pieces of cork round the point of union, taking care to have *one* bud on the stock just *beyond* the top of the cork, then complete the job by putting a tie of wire round the top and the bottom of the cork, twisting it tightly with the pliers. This kind of grafting should be done in the early spring, and it will succeed out of doors or under glass. When the graft has taken, the growth from the stock may be shortened and eventually cut clean away, and the joined parts covered with soil, which is easily done, seeing that the grafting is done quite low down. The cork being elastic will give way under the pressure of growth, and if ordinary thin bouquet-wire be used, that also will soon rust away, so that the removal of cork and ligature is unnecessary. We are unable to say who is the best grafter in this country. One of the best manuals on Vine culture is that by Mr. A. F. Barron, entitled, *Vines and Vine Culture*, published at 171, Fleet Street, E.C. The 3rd edition was brought out in 1892.

Tomatos: *R. J. B.* Except so far as it may have resulted from shade caused by leaves, &c., we are unable to account for the irregularity you complain of.

Vines: *J. H, Alnwick.* In view of the small fungus which moleats your Vines and the fruits, it would be advisable to use the Bordeaux Mixture about the house and on the Vines, making it rather weaker than the ordinary formula for safety's sake, and keep flowers-of-sulphur in pans of water in spots where it may be readily evaporated; also smearing the hot-water pipes with white-wash containing sulphur. Do not put any in evaporating-pans over the pipes when forcing begins, as these pans with or without sulphur are more injurious than otherwise.

and BACHELOR'S WALK, DUBLIN.

XL ALL LAWN SAND.

NOW IS THE TIME TO USE IT.

An exterminator of Daisies, Plantains, Docks, and other unsightly Weeds from Lawns, and a Fertiliser for the Grass combined in one. Guaranteed the finest and most effectual preparation ever offered for the purpose. Please note the following, from a well-known Gardener:—"The Lawn Sand which I had from you last autumn far exceeded my expectations in results. Used on a very weedy and impoverished part of the lawn, the same has this season been most conspicuous by the luxurious growth and absence from weeds. I have no hesitation in stating that whoever may give it a trial will also be satisfied with the result. — T. TURTON, The Gardens, Maiden Erlegh, Reading."

A fine dry powder, supplied in air-tight tins:—2 lb., 1*s.*, 7 lb., 3*s.*; 14 lb., 5*s.*; 28 lb., 8*s.* 6*d.*; 56 lb., 16*s.*; 112 lb., 30*s.*

Carriage paid on 1 cwt. and upwards.

Full directions for use on all tins.

G. H. RICHARDS, Manufacturer, Old Shot Tower Wharf, Commercial Road, Lambeth, London, S.E.

Trade supplied on best terms,

BONES! BONES!! BONES!!!—Any size from dust to 1 inch, at 10*s.* per cwt. Carriage Paid on 1 cwt. Special quotations to large buyers.

Terms, Cash with Order.

E. S. WILES AND LEWIS, Bone Crushers, St. Albans.

GISHURST COMPOUND, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water; 4 to 16 ounces as a winter dressing for Vines and Orchard house trees, in lather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1*s.*, 3*s.*, and 10*s.* 6*d.*

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6*d.* and 1*s.*, from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

FISH MANURE for VINES and PLANTS.—GEO. HARRIS, Esq. (Head Gardener to His Grace the Duke of Northumberland), Alnwick Castle Gardens, writes:—"I have applied your Manure to Vines and many kinds of plants with excellent effect." In 1 cwt. bags, £3 10*s.* per ton, 4*s.* 6*d.* per cwt. Carriage paid.—THE GREAT GRIMSBY POULTRY GRIT AND MEAL COMPANY, Grimsby.

CROSS'S GARDEN FERTILISER.—For Vines, Pot Plants, Fruit Trees, Vegetables.

MURRAY'S "ELECTRIC" MILDEW and INSECT DESTROYER, a purely Vegetable preparation, harmless to plant life, a perfect cure of Mildew and all Insect Pests.

ALEXANDER CROSS AND SONS, 79, Mark Lane, London.

HUGHES' VAPOUR ROLL
FUMIGATORS.

C. BEESON, Bone Mills, St. Neot's, Hunts.

"12, Knowle Road, Brixton, London,

"I have tried this fertiliser on various garden crops, and I am able to say that it is an excellent Manure for Vegetables, Flowers, Vines, and Fruit Trees.

"A. B. GRIFFITHS, Ph.D., F.R.S.E., F.C.S."

ARMITAGE'S INVINCIBLE MANURE.

STIMULATING! ECONOMICAL! LASTING!

The Best Fertilising Compound.

Report of Analysis made by Alfred Sibson, F.C.S., the Analytical Laboratory, 23, St. Mary Axe, London, E.C.:—

"This is a HIGH-CLASS CHEMICAL MANURE, especially suited for Garden use. It contains about 6½ per cent. of Ammonia derived from Organic matter, Ammonia Compounds, &c., and with a good proportion of Phosphates (both soluble and insoluble), Potash, &c. As its physical properties or 'condition' is also well attended to, it will, in my opinion, be found a VALUABLE MANURE for GENERAL HORTICULTURAL PURPOSES. (Signed) ALFRED SIBSON, F.C.S."

PRICES.—In Tins: 3*d.*, 6*d.*, and 1*s.* each; or Free by Post for 6*d.*, 10½*d.*, and 1*s.* 6*d.* In Bags: 7 lb., 1*s.* 6*d.*; 14 lb., 2*s.* 6*d.*; 28 lb., 4*s.*; 56 lb., 7*s.* 6*d.*; 112 lb., 14*s.* 6*d.*

THE BEST & CHEAPEST FUEL for GREENHOUSE BOILERS, STOVES, & HEATING APPARATUS.

ANTHRACITE SMOKELESS COAL.

G. R. CARTER AND SON supply their large NUT or COBBLE COALS (the Nuts being about the size of a Walnut, and the Cobbles about the size of a man's fist), delivered by van, at any address within the 4 mile radius of Charing Cross; or in truckloads, at any Railway Station. This Coal is **absolutely smokeless,** and it requires much less attention than any other description of fuel, burning for twelve hours at least without any supervision, and giving from five to ten degrees more heat than Coke. Quotations on application to—

G. R. CARTER & SON, 53, 54, & 55, COAL EXCHANGE, LONDON, E.C.

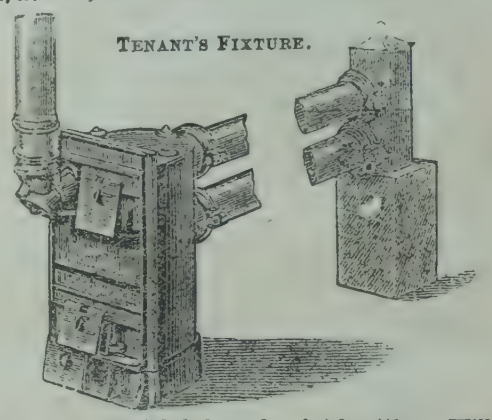
AMATEUR FORCING HOUSE.



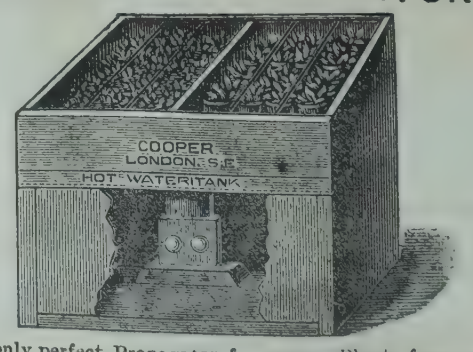
The utility of this house for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance, it being a structure constantly in request, but almost hitherto unknown. See LIST, p. 22. Send for LIST, post-free.

"INVINCIBLE" HOT-WATER APPARATUS.

Most Efficient and Cheapest in Existence.

Made in six sizes: No. 1, to drive 75 ft., £1 15*s.*; No. 2, 100 ft., £3; No. 3, 200 ft., £4 10*s.*; No. 4, 275 ft., £7; No. 5, 375 ft., £7 15*s*; No. 6, 500 ft., £9; of 4-in. pipes.

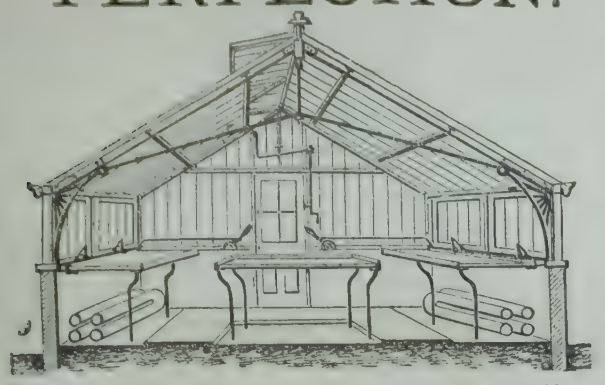
Requires no sunk stokehole, and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.



Cost of complete apparatus for Greenhouse with 4-in. pipes, flow and return along one side, cut and fitted; so that if the internal measurement of the Greenhouse is given, the apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all. Securely and carefully packed on rail at the following respective prices:—7 ft. by 5 ft., £2 15*s.*; 9 ft. by 6 ft., £3; 10 ft. by 7 ft., £3; 12 ft. by 8 ft., £3 5*s.*; 15 ft. by 10 ft., £4 5*s.*; 20 ft. by 10 ft., £5 5*s.*; 25 ft. by 10 ft., £6 5*s.* See page 186 in List.

COOPER'S HYGIENIC HEATER.

Burning Parafine or Gas without smoke or smell. These Heaters are constructed as a means of heating by Hot Air without the use of hot water or fires. Its peculiar construction economises the heat generated, so that there is no waste of heat or fuel. There being perfect combustion in this stove, and nothing whatever injurious to plants, but actually everything conducive to their health, it should be observed that plants may be had in full bloom throughout the severest winter. This cannot be obtained in stoves of other systems. The temperature can be regulated to a nicety to suit all requirements, being raised 15 degs. to 45 degs. above that of the outside. From 16*s.* complete. For full particulars, and prices of other sized Heaters, see ILLUSTRATED LIST, post-free on application.



THE RAPID PROPAGATOR.

The only perfect Propagator for raising Plants from seeds, slips, or cuttings:—

1 ft. 8 in. by 1 ft. 6 in.	£1 0 0
2 ft. 6 in. by 1 ft. 10 in.	1 4 0
4 ft. by 2 ft.	1 8 0

NOTICE TO ADVERTISERS.—*In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.*

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—*Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.*

POSTAL ORDERS.—*To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to* A. G. MARTIN, *as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.*

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST *reach the Office by first post, Thursday morning.*

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements,
41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

SEED TRADE.—SHOPMAN (HEAD), or MANAGER, open for engagement. Over twenty years in last situation.—Particulars on application to HERD BROS., Nurserymen and Seedsmen, Penrith.

"STICKING TOGETHER IN ALL SORTS OF WEATHER."—The friendship between man and man which enables them to stick together in all sorts of weather is a friendship worth having. In times of prosperity some of us can hardly distinguish a friend of this kind from one of the other sort. But let the storm clouds gather and we soon know who the true friend is. And when the clouds of sickness gather about us we turn naturally and instinctively to HOLLOWAY'S PILLS and OINTMENT. They are the only friends whose friendship is worth a rap at such times. We know it, and we turn to them, confident in the knowledge that they will restore us to health.

DENDROBIUM HILDEBRANDTII.

MESSRS. PROTHEROE AND MORRIS have received instructions from Messrs. Charlesworth & CO., Heaton, Bradford, to OFFER by AUCTION at their Central Sale Rooms, 67 & 68, Cheapside, London, E.C., on FRIDAY NEXT, November 2, at half-past 12 o'Clock, the whole stock of the new and beautiful

DENDROBIUM HILDEBRANDTII, Rolfe,

Offered for the first time by public auction; Flowers, sulphur yellow, to a trifle darker towards the centre 3 to 3½ inches in diameter; lip of same colour, unusually large and open, with an orange blotch in centre. The plants are very distinct in appearance, resembling slightly Dendrobium nobile; the bulbs, however, are flat, varying in length, from 10 to 30 inches, and show an abundance of flower spikes. The plants offered are in robust health, and are well established, and will flower in spring.

CYMBIDIUM SPECIES.

Very distinct, collected from the Dendrobium Hildebrandtii district. A few plants only arrived alive, which are offered. The plants were collected 200 miles from the nearest inhabited place.

DENDROBIUM SPECIES.

Probably new; in the way of Dendrobium fimbriatum. Very slender, and thin growths, which produce flowers with great freedom. Not seen in flower by the collector. Also a fine lot of

DENDROBIUM DALHOUSEIANUM

and other choice Orchids.

On view morning of Sale, and Catalogues had.

Tuesday Next.

MESSRS. JAMES AND BAXTER will SELL by AUCTION, at their spacious Sale Rooms, 35, Temple Street, Birmingham, on TUESDAY NEXT, October 30, 1894, at half-past 11 o'Clock, Three Tons of HYACINTHS, TULIPS, CROCUS, and other DUTCH BULBS; also Ten Cases of Roman HYACINTHS, Roman and Paper White NARCISSUS, FREESIAS, LILIUM CANDIDUM, L. HARRISII, Italian HYACINTHS, &c. Catalogues free.

Thursday Next.

MESSRS. JAMES AND BAXTER will SELL by AUCTION, at their Sale Rooms, 35, Temple Street, Birmingham, on THURSDAY NEXT, November 1, at half-past 11 o'Clock, 1000 AZALEA INDICA, fine well-budded plants; 250 AZALEA MOLLIS, 6 baskets of mixed PALMS, FICUS, &c., from Belgium; a very fine collection of Hardy HERBACEOUS PLANTS, FRUIT TREES in variety, 600 DWARF ROSES and POT ROSES, 200 lots of DRACÆNAS, GARDENIAS, CROTONS, FERNS, and other GREENHOUSE PLANTS; 250 lots of RHODODENDRONS, CONIFERÆ, LAURELS, HOLLIES, CLIMBING PLANTS, and other General NURSERY STOCK; 3 tons of DUTCH BULBS, LILIUM HARRISII, Roman HYACINTHS, &c.

On view morning of Sale. Catalogues free. Commissions carefully executed. Goods packed and despatched.

BIRCHALL, BROS., & CO., 20, Polygon Rd., Southampton.

GREAT SALE OF ORCHIDS.

JOHN COWAN & CO. (LIMITED),

Have received instructions from
D. DE Y'BARRONDO, Esq., of Ullet Road, Liverpool,
to sell his entire collection of Orchids for him by private treaty, as he is relinquishing the cultivation of Orchids for the present. With this end in view, the collection has been removed to the Company's premises at Garston.

Mr. de Y'barrondo has for many years been known as an ardent collector of Orchids, and his collection is well-known in this neighbourhood, and indeed, throughout the country. The collection is in fine condition, and there are many fine specimens as well as numerous rare and fine varieties in each section.

The Company have also just purchased from the trustees of the estate of the late
E. G. WRIGLEY, Esq., of Victoria House,
Dukinfield, near Manchester, the collection formed by that gentleman. The principal feature of this collection is a choice lot of

HYBRID AND OTHER DENDROBIUMS.

Mr. Wrigley's collection was purchased and sold in this establishment nearly twelve months ago, but Mr. Wrigley immediately commenced to collect again and devoted his attention specially to Dendrobiums, bringing all his previous large experience to bear on securing only the choicest and best of each kind. The result is a most valuable collection of choice gems.

These two lots taken together will form one of the best collections which has ever been offered by the Company; and they are now on view. Catalogues have been prepared, and will be posted to all the Company's patrons, and to any one who may send their name and address for that purpose, on FRIDAY, the 26th inst., and the collection will be on sale from MONDAY, the 29th inst. Orders will be executed strictly in rotation, and no prices will be quoted or Catalogues shown to anyone before the date named, so that all purchasers may have an equal chance.

JOHN COWAN & CO., LTD.,

THE VINEYARD and NURSERIES,
GARSTON, near LIVERPOOL.

HARDY HOME-GROWN FRUITS.

NURSERIES 450 ACRES.

FRUIT TREES A SPECIAL FEATURE.—FRUIT TREES—FRUIT TREES.

We have long been famed for our FRUIT TREES. They are admitted by all who see them, and by all who have had them, to be unsurpassed. Hardily grown, carefully cultivated, splendidly rooted, entirely clean and free from blight or parasites, vigorous and robust in constitution, it is absolutely impossible to get finer trees at any price. All the best kinds in cultivation; all true to name. Our FRUIT TREES are sent to every part of the Kingdom, and abundant evidence from every County in England can be given as to excellence of quality.

Inspection cordially invited, when facilities will be offered for selection of trees from the stock on the grounds.

JAMES VEITCH & SONS

Beg to direct special attention to the following Sterling Novelties:—

NEW TOMATO—FROGMORE SELECTED.
(*First-class Certificate, Royal Horticultural Society, April* 24, 1894).

This exceedingly fine variety was raised by Mr. Thomas, The Royal Gardens, Frogmore and is the best Tomato yet introduced. The fruit is of good medium size, and a deep bright red colour, smooth and almost round, very firm and solid, with flesh of unusual depth. It is a most prolific and continuous cropper. For early forcing this variety is unequalled, and having ourselves grown it extensively during the past season, we confidently recommend it as a very desirable sort. It is also very suitable for outdoor cultivation. Mr. THOMAS, writing August 27, says:—"You will be pleased to hear that it is an excellent variety for outdoor culture. It has been tried here this season side by side with all the best sorts recommended for this purpose, and it has proved itself to be by far the best of any I have grown."

Per Packet, 2s. 6d.

NEW MELON—INGESTRE HYBRID.
(*Award of Merit, Royal Horticultural Society, May* 8, 1893.)

This high-class seedling was raised by Mr. Gilman, of Ingestre Hall Gardens, and is the result of a cross between Hero of Lockinge and The Countess, two well-known varieties of superior quality. The fruit is globular in shape, of medium size, and a bright golden-yellow, most beautifully netted, with very thin skin. It has great depth of flesh, which is almost white, very sweet and juicy, and the flavour superb. The plant is of robust constitution, and a very free setter.

Per Packet, 2s. 6d.

CAMPANULA PYRAMIDALIS COMPACTA.
(*Syon House variety.—Award of Merit, Royal Horticultural Society, August* 9, 1892.)

Raised by Mr. Wythes, and quite distinct from the older form, being dwarfer, the flowers larger and deeper blue, with more substance. The plant is of dwarf pyramidal habit, exceedingly free-flowering, and clothed with foliage to the ground. The growth being strong and erect, staking may almost be dispensed with. As a decorative plant, this variety is invaluable, the plants being covered with bloom, which lasts a very long time.

Per Packet, 1s. 6d.

STREPTOCARPUS—VEITCH'S NEW HYBRIDS.
This popular greenhouse plant has been brought to a very high state of perfection by careful culture and hybridization, and the seeds now offered are selected from plants far in advance of the older varieties—in richness of colour, size, and form of flower, containing only the most distinct and rarer shades, particularly amongst the purple, purplish-violet, bright red, deep rose, and rich rosy-purple. The whites are more pure, and the markings on the throat more defined.

Per Packet, 2s. 6d.

NEW AND BEAUTIFUL HARDY SPIRÆA.
SPIRÆA ANTHONY WATERER.
This is a sport from the well-known Spiræa bumalda, from which it differs only in colour, the flowers being a rich crimson, borne in large cormbs thickly on the plant.
It is a continuous bloomer, and is without doubt the most important addition to hardy flowering plants of many years.
FIRST-CLASS CERTIFICATE,
Royal Horticultural Society of London.
Nice plants, 7*s.* 6*d.* each, will be distributed in November next.

CHASSELAS GRAPES.

FROM August till October is a busy Grape-selling time with the peasants of Thoméry, near Fontainebleau. They have the natural monopoly of the production of the Chasselas Grapes—familiarly known as the "Queen of French table Grapes"—and raise them with a combination of care—aye, almost affection. The soil, climate, and position of Thoméry also unite to produce this splendid Grape, and which is so delicately preserved as to be able to supply the tables of the Pope and the Czar up to the month of March. In the Paris market, the Thoméry Chasselas Grapes command next to any price asked. But there are large plantations of Chasselas near Montpellier, and their cultivation forms an important industry near Algiers. Switzerland also cultivates a variety of Chasselas for making white wine. The Chasselas has many characteristics in common; the young leaves at their development have a peculiar russet colour, the berries are spherical-shaped, and the juice deliciously mild and sugary. The Chasselas comprises four principal varieties, which in turn have sub-varieties; the Doré, the Violet, the Rose, and the de Falloux. The "Doré" is very widely spread; peculiarly conical in shape, skin delicate, and flavour delicious. It is precocious, thrives in divers conditions, but a good rich light soil, and a temperate climate suit it best. When intended for wine-making, a strong soil and an exposed situation are preferable. The Chasselas is kept short pruned. The "Violet" yields a fruit equal in savour and beauty to the Doré, but is more cultivated for wine-making—and especially in Switzerland; the Grapes can to a certain degree resist slight and early frosts. The "Rose" is a variety—but less grown—of the Doré, while the leaves are more long than broad, the berries are spherical and pass from a clear green to a deep red. The "de Falloux" kind has large berries, very agreeable, juicy, and of a bright rose colour. It is remarkably noted for its fertility, and the beauty of its fruit.

The general crop of Chasselas is gathered about the middle of October. It requires skill to know when the Grapes are ripe; the berries should be transparent and of a blond yellow when examined in the shade; or, cut a berry in two, if the pulp remains all jelly, it is mature; if juice streams, it is not fully ripe. The Grapes ought to be gathered in the morning when the dew has evaporated, and before they become heated by the sun's rays. The Grapes are cut with scissors generally, leaving attached to the stem of the bunch 2 inches of the branch on each side of its point of junction. The bunches

*

are then deposited as carefully as if they were eggs, in small baskets, lined with paper shavings or leaves, to be carried to the fruit-room, so as not to remove the bloom from the berries. The Grapes lowest down on the Vine ripen earliest, and should be cut accordingly. Grapes gathered from Vines growing on dry light soils keep better than those raised on humid land; old Vines yield fruit better perfumed fruit, and of superior quality, while keeping better than that gathered from Vines only twelve years old.

At Thoméry, the Chasselas are raised either as ordinary espaliers against walls, or in open alleys against stakes; or in rows with three lines of galvanised wire, and known as *contre espaliers*. But there are many systems for training the shoots; the main point is to allow plenty of space, of air, and of light. When the berries commence to form, sharp scissors are used to remove all that are stunted, or which appear to be too closely pressed together; indeed, many growers remove the moiety of the berries. But this is not all; to secure the golden blend tint, what the peasantry illustrate by the popular saying, "*Le renard a pissé dessus*," the leaves should be gradually pinched off, to admit the sunlight.

Grapes, when crushed in the wine-vat, constitute the must. The latter has a very complex composition; in 100 parts, the water varies from 70 to 85, the sugar 12 to 30, and the mineral matters from 2 to 4, according to the soil, climate, and the variety of Grape. The sugar, salts, and acids are in the juice; the essential oil and tannin in the skin and pips, and the colouring matter in the cells of the interior of the skin. As the fruit ripens, the acids are changed into sugar under the influence of heat and light, the potash and phosphoric acid augment in proportion as the Grapes become sugary. The varieties of table Grapes are legion, and of late, wine-making Grapes are largely sold for consumption—1½*d*. per lb. The colour of the seeds, or pips, of table Grapes varies from a mother-of-pearl white to a black-violet. The largest table Grapes are not the best flavoured; they are somewhat insipid, have the skin thick, and the percentage of sugar is low. In France white Grapes are preferred for table purposes, for their firmness, flavour, and more beautiful shape—hence the favour of the Chasselas, Royal Madeleine, and White Muscat. Of black Grapes, the Frankenthal the Crusant, the Black Muscat, and the Blue Portuguese, are preferred. The two grand secrets in table Grape culture are, the cutting out of unpromising berries when commencing to form, and pinching off the leaves, when ripening sets in. The preservation of the Grapes fresh up to March, necessitates a room at once dry, of a sustained uniform temperature, and dark; the Grapes may lie on little slabs of wood, or be suspended from the ceiling, or hung from racks or the severed stem allowed to dip into open-mouthed, bottles of water—the latter to be periodically renewed. Once a week the room ought to be visited, and all objectionable berries removed.

In 1892, France imported French ordinary table Grapes, chiefly from Spain and Algeria, to the extent of 3,703 tons, valued at £44,000. She exported in the same year, 357 tons of table Grapes for £4,300, of which 8 tons to England, 15 to India, and 269 to Switzerland. The best foreign customers for the Thoméry Chasselas are the Imperial Court of Russia and the Vatican. The Czar receives the first and the last of the crop—the latter fetching 19*s*. per lb. Just now peasants—always old men in black hats and blouses—parade the streets of Paris with tasty little baskets, containing, as they say, true Thoméry Chasselas; 2 lb. of fruit for 2½ francs. The vendors are only made-up peasants, and the Grapes are Chasselas, but from Algiers, and two-thirds cheaper. About five dealers in the Central Markets form a "trust" or ring, to monopolise the products of Thoméry. And if the visitor went to this noted village he would not be supplied with the fruit, unless the hotel-keepers raise the Grapes themselves, which is questionable. It may be presumed, a good deal of the Grapes to be had there come from Algeria. But the difference is easily detected, not alone by the eye, but by the taste. The Algerian Chasselas has a trace of toughness in the skin—and lacks the melting, ambrosial-nectar pulp of the genuine Thoméry Chasselas Grapes. *E. Conner.*

NEW OR NOTEWORTHY PLANTS.

VANDA KIMBALLIANA, *Rchb. f.*, Var. LACKNERÆ, *Krnzl.*

This is the best variety we noticed in a large stock of the typical Vanda Kimballiana in the collection of Mr. C. Lackner, at Steglitz near Berlin. The flowers are snowy-white, without even a tinge of purple, and with only a very few small golden spotlets in the mouth of the spur. The size of the flower is the same as in the best specimens of the type, or even rather bigger. It is a true albino. This character is so pronounced in the whole appearance of the plant, that typical ones and such as belong to the variety are discernible even in the non-flowering state. The typical plants of Vanda Kimballiana have, as everybody knows, a dark purplish or a dark green colour, so densely covered with purple spots that the whole appearance of the plants, from the uppermost leaves to the end of the thriving roots, is a very sombre one. In the variety the general colour is a very clear green, the purplish colour being reduced to small widely dispersed spots. The roots are pea-green, with some white "velamen" just before the tip of the growing points. The contrast between the typical specimens with the rosy flowers and the chaste snowy ones of the variety, is a very lovely one. It seems that the variety is a very rare plant. Among more than a hundred large and luxuriantly growing specimens in the collection of Mr. Lackner, we found only one single specimen of the variety. It is dedicated to Mrs. Lackner in sincere acknowledgment of the interest she has manifested in horticultural and especially orchidographical questions in her hospitable home at Steglitz. *F. Kränzlin.*

HYBRID AUTUMN AND WINTER BEGONIAS.

The autumn-flowering Begonias are most useful at the dull period, when bright flowers are most appreciated. If I am enthusiastic with regard to their value at this season, it is because we have so few autumn flowers which produce their flowers in such profusion and last so long. As is generally well known, this section is the result of crossing Begonia socotrana with the pollen of some of the tuberous varieties. By this cross the season is prolonged; indeed, it may be said to be continuous, as there is no difficulty in blooming these hybrids to the time the tuberous kinds come in, and should there be any gap, the evergreen or perpetual-flowering kinds fill up the vacancy. The first hybrid raised, and what may be termed a winter bloomer, was John Heal, and doubtless it is still one of the best of the trio, for though the flowers are a little smaller than those of the later hybrids, they remain so long a time on the plant before they shrivel, that I look upon this variety as the most valuable of the type. This variety was raised at Messrs. Veitch's nursery by the well-known hybridist who has done so much to improve the Amaryllis, the hybrid or greenhouse Rhododendrons, and other plants, and was first exhibited in October, 1885. It was at once noticed by the horticultural press as a great gain, and a valuable winter-flowering variety. With the rage for huge Chrysanthemums, we are apt to overlook our other winter flowers of more graceful character, and certainly more lasting. The other varieties raised in a similar way to John Heal are, Adonis, certificated in 1887; this is one of the first named progeny, John Heal being crossed with one of the tuberous varieties. The flowers, though of a rosy-carmine, are more scarlet towards the centre, and larger than in the first hybrid, but continue a long time in full beauty, lasting for weeks in an intermediate-house temperature; the flowers are best during November and later, thus showing the plant's true character as a winter-bloomer. Winter Gem is a lovely winter-bloomer, the flowers remaining in perfection for weeks, and not dropping, like the evergreen and tuberous-rooted section. This last-named variety produces large corymbs of rich scarlet-crimson flowers, much the same in size as those of John Heal.

The varieties John Heal and Adonis are readily raised by cuttings—these struck in the spring or early summer, make nice plants for winter bloom; struck in a sandy compost in a gentle heat, they soon root, and may be grown in frames during the summer, and in September or October placed in warmer houses near the light for winter bloom. B. Winter Gem is more readily increased by propagation of the small growths at the base of the stem; they strike in heat, but require to be sparingly supplied with moisture at the start. They are best grown in small or medium-sized pots, with ample drainage, as in a large pot they get too much moisture in dull weather, unless carefully watered. The plants do not require the rest or drying off in the same way as do the tuberous-rooted kinds, but I find a short rest in a cooler and dryer house after flowering beneficial. When in bloom, food may be given to robust plants, keeping the flowers free of moisture, and near the light, to secure the bright colours so much admired in the flowers. *G. Wythes.*

KEW NOTES.

Sternbergia macrantha.—Bulbs of this beautiful species have lately been sent to Kew by Mr. E. Whittall, of Smyrna, and they are now in flower in a border and in pots in a cold greenhouse. The species is described by Baker as having a bulb 1½ inch in diameter, with a neck 4 to 6 inches long, pale brown tunics, lorate glaucous leaves ¾-inch broad; flower-stalk as long as the bulb-neck, flowers bright yellow, produced in autumn, the tube cylindrical, 2 inches long, the segments oblong, over an inch wide. In other words the flowers are as large and effective as those of well-grown Colchicum speciosum, and as yellow as Crocus aureus. The species is new to cultivation, and is one of the best of the many good things we owe to the enthusiasm and enterprise of Mr. Whittall. A figure of it will shortly be published in the *Botanical Magazine.*

Hæmanthus Clarkei×.

This is a hybrid between H. albiflos and H. coccineus, which was raised years ago by Colonel Trevor Clarke, who presented a plant of it to Kew in 1882. It is grown in pots and also in an unheated frame, and it flowers freely every year. It is more like H. coccineus than the other parent, having several leaves 4 inches wide, glabrous on both surfaces, smooth-edged and dull-green. The scape is 5 inches long, slightly flattened, the bracts 2 inches by 1½ inch, coloured dull crimson, the flowers crimson, paler at the base, the anthers golden; and the pistils, which are a ¼ inch longer than the stamens, white. So far as I know, it is the only hybrid Hæmanthus known. The Kew plants have been labelled H. Clarkei for some years, but the name is only now published for the first time.

Honckenya ficifolia.

Specimens of this plant have lately been sent to several London nurserymen, who have submitted them to Kew for identification, and asked if the plant is known to be in cultivation. It has been grown at Kew since 1889, when seeds of it were received from Lagos along with specimens of the Jute-like fibre extracted from its stems (see *Kew Bulletin*, 1889, p. 15). The genus is related to Sparmannia and Corchorus, H. ficifolia being the only species. It forms a shrub, or small tree, probably something like Sparmannia, with hairy, lobed leaves, about as large as the leaves of common Sycamore, and the flowers are borne in short few-flowered terminal racemes. They are nearly 4 inches across, purple, the sepals narrow, brown, and hairy; the

petals 1½ inch wide, cordate, and stalked at the base, with a cluster of yellow stamens in the centre, as in Sparmannia. So far, the plant has grown badly at Kew, but it is worth struggling with, as the flowers are decidedly handsome. *W. W., Kew.*

THE PULSOMETER IN FRUIT CULTURE.

During the spring of 1892, W. Welchman, Esq., my employer, was persuaded to buy a pulsometer on wheels for watering purposes in his orchards, of about 27 acres in extent, running small grips or trenches near the trees, so as to saturate the soil with water. The machine pumps 3,800 gallons per hour; and having been informed by the makers that it would lift water by means of a 2-inch pipe to a height of about 70 feet, I thought it would work three or four small lengths of indiarubber hose. Having fixed four small nozzles on to the machine to carry ⅝-inch pipe with Stott's sprayers, we made a trial of it with the best possible results. By having a small piece of hose-pipe joined on to the suction-pipe and furnished with a tap, a liquid insecticide can be used with the water, and the supply of the former can be regulated to a nicety at the will of the operator, and the spray is thrown with regularity. The pulsometer uses 2 cwt. of coal per day, and with it we can syringe 27 acres in four days, costing about £1 per day, including the price of the insecticide. The sprayers can be set to throw a fine mist or coarser, as may be desired. Some of the fruit trees were badly attacked last year with red spider; but the sprayer completed their destruction. The sprayers are sometimes as far as 170 yards distant from the engine, and work without any diminution of power. We have 260 yards of hose; but, with the exception of one part of the orchard, we have water all round it, and have no need to use so long a piece. One orchard is 8 acres in extent and nearly square. To get the water readily in this one, we cut a drain, 6 feet deep across it, and sunk petroleum casks about 25 yards apart to serve as water reservoirs for the machine. A 3-inch suction pipe is used, and the insecticide being drawn in with the water, it all goes through the pulsometer and becomes perfectly mixed together. For tall trees we have jointed brass rods, 6 feet long, to screw into each other, with a sprayer on the end. I now use the hose for watering, instead of the grips as formerly. *Wilson C. Smythe, Upwell, Wisbech, Cambs.* [Our illustration (fig. 65) shows the Pulsometer at work. Ed.]

Fig. 65.—The pulsometer: an apparatus for watering, spraying, etc.

The Rosary.

THE ROSE GARDEN IN OCTOBER.

This most disappointing season is over, for although we may still look for some flowers, especially amongst our Teas, yet the thoughts of the Rose-grower will be more directed to the future than to the present, and those thoughts will take the shape of what he shall do to alter or improve his garden for another year. I sometimes see articles written by nurserymen, who have of course thousands and tens of thousands of Roses, detailing what they have done or intend to do, but these are utterly useless to the amateur, whether he be an exhibitor or not. My main object is to write for those who, like myself, are owners of a small garden. It would be very little use, for instance, for anyone to suggest the grouping of Roses; this requires a considerable amount of room, and would be impossible.

I think that anyone who means to do anything in his garden in the way of Roses should first pause and consider what he wants; does he wish to have such flowers as he is in the habit of seeing at exhibitions, or does he want quantity rather than quality? much both of the manner of treatment and the varieties he

grows will be regulated by these considerations; if he have room he will perhaps consider with the Scotchman, "Baith's best," but for my own part, I much prefer one good bloom at the end of a shoot to three or four inferior ones crowded together, and, should the weather be wet, a mass of pulp rather than Roses, and I therefore contrive to have the second shoots which give us autumnal blooms disbudded as carefully as in the proper Rose season. On looking through my small Rose-garden to-day, I have found some instances in which this has been overlooked, notably, in a plant of Margaret Dickson, one of our best autumnal bloomers; where disbudding was carried out there are some clean shapely blooms, but on one which had been overlooked, there were four flowers huddled together, the outer petals all discoloured, and the whole bunch certainly not comely. There is another point on which he should make up his mind, viz., whether he is going to grow many garden Roses; there seems to me a good deal of exaggeration and misconception on this point. A good deal is said about our old garden favourites, of the Hybrid China, Hybrid Bourbons, Provence, and other classes; we are told of the delicious perfume of the old Cabbage and the beautiful form of Coupe d'Hébé, but I do not hesitate to say that in every respect wherein the excellence of the Rose consists, whether in form, size, colour or perfume, we can match and even excel them amongst the more modern Roses, whilst these latter have the very great advantage of sometimes favouring us with autumnal blooms. We are told that the tendency of the public is very much running in the direction of garden Roses. I question this; there are some of a different character altogether, such as the single Roses and the dwarf Polyantha, which are very desirable, the former lasting, it is true, only a short time, but the latter from the prevalence of Tea blood in them continuing for some months; my advice, therefore, would be to those who own small or moderately-sized gardens, not to be wheedled by any feelings of sentiment into giving much space for the "dear old garden Roses!" but to select those which from among the H.P.'s and Teas are well known for their beauty and good constitution. There is another point on which I think growers ought to be very decided, viz, not to admit any scentless flowers into their rosary. Invariably, when one is given a Rose, one puts it to one's nose to inhale its perfume, and the term sweet-scented, as now applied to some Roses, shows that this unpleasant innovation of scentless flowers has made its way amongst us. I believe that Victor Verdier was one of the first delinquents in this particular, and any Rose that has been in any way connected with that flower appears to have inherited this character. Baroness Rothschild is, no doubt, a very beautiful Rose, but it altogether lacks perfume, and yet no doubt it will continue to be a favourite Rose, this defect notwithstanding.

In filling up gaps, I do not think that much expense will have to be gone to in the purchase of new Roses; I do not believe that there is one of the French Roses of 1893 that has made any mark, and it is to our home-raisers that we are to look for novelty. Thus, Marchioness of Londonderry, Mrs. Sharman Crawford, and Marchioness of Downshire, of Messrs. Alexander Dickson & Sons; the Clio and Spencer of William Paul & Son Clara Watson of Mr. Geo. Prince; Charles Gater of Messrs. Paul & Son, will be looked for by those who wish to add beautiful and good constitution Roses to our collections. There is no doubt, too, that the Hybrid Sweet Briars raised by Lord Penzance, and to be sent out by Messrs. Keynes, Williams & Co., of Salisbury, will be equally sought after by those who have space for pillar Roses, or may wish to cover fences or walls.

With regard to the autumn treatment of plants and preparation for the winter, we in the southern part of England are placed at a considerable disadvantage, the entire absence of straw having compelled us to litter our Roses with German moss litter. This is quite inapplicable to the purpose of mulching the beds, which I am always in the habit of doing in the autumn; last year, in accordance with the recommendation of a well-known rosarian in the pages of a contemporary, I covered my beds with a plentiful supply of leaves. They all looked very nice for a while, but the first gale that arose carried them off in all directions, and left the beds bare. They were not only scattered over the garden, but got into my greenhouse and pit, and gave everything a general air of untidiness; so that I resolved never to try that experiment again. Straw, however, is now abundant, and one may hope in some way or other to give the beds a mulching before severe weather sets in. Were nothing else available, I should simply earth-up the plants, and then cover the beds with bracken, which is abundant in our neighbourhood.

My plants, and I hear from others that they are in the same state, have made very strong shoots this summer, and everything should be done to make these available for next season's work. September, which gave us in this locality the heaviest rainfall we have had in that month for many years (nearly 4 inches), has not done much towards ripening the wood, making it more desirable that the cutting-out of the wood of last year should be thoroughly done, and so air and light more freely admitted. There are two ways of treating these long shoots, either staking them or else shortening them by about one-third, in both cases preventing their being knocked about by the wind.

Roses on walls and fences should be also carefully looked after; these will mostly be of the Tea and Noisette section, for in such flowers as Gloire de Dijon and her many daughters, more or less like the parent, and in the Rêve d'Or, William Allen Richardson, climbing Niphetos, and climbing Devoniensis, we have the very best Roses for these purposes, and especially such Roses as Rêve d'Or, where you have almost evergreen foliage, and not the long bare shoots which somewhat mar the beauty of the Dijon section. I have always found it a good plan to attend to these in the autumn, cutting out such wood as may be either unsightly or unsuitable for flower, and laying in some of the young shoots which are sure to have been produced. Teas may be pruned back, but the Noisettes had better be left alone.

I would again recommend Longworth Rambler as giving colour, all the Teas and Noisettes recommended being of various shades of white and yellow. To this may also now be added Crimson Rambler; it promises to be a most useful Rose, but I think more adapted for pillars than for walls. I have not said anything about the protection of dwarf Teas, for in this locality—Kent—I think they are quite as hardy as H.P.'s. But I have seen it recommended to cover them; but this seems to me to be useless, and I generally prune them as hard as other Roses, and the wood of this year, whether protected or not, will suffer either from the frost or the knife. Moreover, the hardiness of the stock is the main consideration in determining the hardiness of the plant, and most of our Tea Roses now are budded on the seedling Briar, and Briar cuttings from our own hedge-rows. *Wild Rose.*

TRELISSICK, NEAR TRURO.

This beautiful property belongs to Mr. Davies G. Gilbert, and is situated about half way between Truro and Falmouth, on the western side of the richly-wooded estuary into which the Fal and other rivers empty themselves. Some idea of its extent may be formed when it is stated that there are eight miles of carriage drives through its woods. The views from the grounds are of the loveliest kind imaginable, owing to the undulating character of the country, and to the windings of the estuary. It seems almost impossible to conceive scenery more beautifully diversified. Looking north-east, there is a magnificent view of Lord Falmouth's mansion of Tregothnan, about 2 miles off as the crow flies, and more than 200 feet above sea-level; whereas the highest points about the grounds of Trelissick are less than 100 feet high. A special cutting as been made through the woods of Trelissick, to obtain this view of Tregothnan, and visitors are brought by residents from many miles round to ask permission to see this charming bit of scenery, in which the broad river-like estuary twice crosses the landscape. The views from the terrace in front of the mansion are singularly varied, a change of position of only a few feet affording a new prospect. Falmouth and its harbour are the most conspicuous objects, while further on is Pendennis Point, beyond which may be seen vessels passing up and down the English Channel. The pleasure steamers between Truro and Falmouth are frequently passing by, thus introducing motion into a picture of lovely still life.

The lover of trees and shrubs will, however, be more attracted by the curious and interesting plants, and by the good taste which is evidenced in the manner in which they have been grouped. Two specimens of Abies Smithiana (A. Morinda), from the mountains of Northern India, plants of which are so often cut down by frost in the young state, are here 60 feet high, with glaucous foliage of an uncommon shade, and numerous pendent cones. Benthamia fragifera, plants of which had flowered well, were fully 30 feet high (fig. 66). Embothrium coccineum, which was showing its last two trusses of scarlet blooms on August 16, had been 25 feet high, but lost 10 feet during a blizzard, and is now not more than 20 feet, had been covered with brilliant flowers. Paulownia imperialis, which flowers here every year, 35 feet; Ceanothus azureus, 26 feet; Cotoneaster Hookeri, 6 feet high, and as much across; C. acuminata, which flowers profusely, and is 25 feet in height; Acer polymorphum, 23 feet; Acacia affinis, which had been 40 feet, but was seriously injured by an unusual frost of 17° this spring, is now shooting from the old branches up to 6 feet from the ground; Abutilon vitifolium, 20 feet, which had in spring a profusion of mauve-coloured flowers; large bushes, 20 feet high, of Pittosporum Mackayii, with its black-barked shoots; numerous specimens of Retinospora squarrosa, of a similar size to the last-mentioned; an Ozothamnus, 9 feet; large bushes of Choisya ternata, which flowered three times last year; four white-flowering species of Escallonia, viz., montevidensis, floribunda, scillonensis, and Phillipiana; Eulalia zebrina; Berberidopsis corallina, covering a wall 12 feet high, with scores of its deep crimson pendulous blossoms; Sparmannia africana, Grevillea rosmariniflora, Raphiolepis japonica, Cassinia fulvida, 6 feet high and 8 feet across; Rodgersia podophylla.

These are but a selection amongst the lovely things that are growing mostly in wild luxuriance here, and are rarely found to be hardy in any parts of Great Britain excepting in this highly favoured county of Cornwall, where the influence of the Gulf Stream generally prevents frosts of great severity, while the Atlantic breezes moderate the summer heat.

Our illustration (fig. 67) shows the Lily pond margined with Richardia æthiopica and Primula japonica, and at the further end may be seen a magnificent plant of Gunnera manicata, covering a space 32 feet in diameter, the largest leaf being 9 feet 3 inches in diameter. A previous illustration (fig. 66) shows how well Benthamia fragifera grows in this favoured garden.

The proprietor of this charming place is very fortunate in having had for many years so enthusiastic a gardener as Mr. Sangwin, who is most obliging in pointing out the many objects of interest on the property. To some of these we may refer upon another occasion.

CHRYSANTHEMUMS ABOUT LONDON.

(Continued from p. 476.)

Finsbury Park.—It is always a pleasure to view the display in this park, for it is rarely inferior to any other collection. Last season we had occasion to remark that Mr. Melville had got a new house at considerable expense for the large number of Chrysanthemums that is annually grown here, but although the house was built for this purpose, the majority of the plants are staged in the narrow span-roofed

house of considerable length that was used prior to last season, and the new house which during the summer has been furnished as a warm greenhouse with Palms and other decorative plants, is still retained for that purpose. Some of the 4000 plants, and such as could not be put in the narrow span through lack of room, have been arranged in small groups in this house, however, and so the new one is an agreeable spot, from the presence of flowering plants and foliage plants combined. It is to the other one that the greater interest attaches to the Chrysanthemum lover, as here the greater part, as well as the choicer plants of the collection are staged. The group is arranged in the shape of a ridge, with a walk all round, so that one half of the display only is visible at the same moment; and though in several respects such a display as was possible in the larger and much wider house is not obtained here, yet the arrangement is not by any means a poor one, and the ingress and egress of visitors is easy, and manageable. A number of the newer varieties have been added, but few of these had yet opened flower. Amongst older kinds, Viviand Morel was capital; Avalanche, with four good blooms on each plant, was noticed in many instances; and Sunflower, W. H. Lincoln, and W. Tricker, were large and good. The large Duchess of Devonshire was noticeable, and specimens of the old James Salter, Eynsford White, Stanstead White, Margot, and Val d'Andorre also. Louis Bœhmer had its hairy flowers almost expanded, and there were large, highly-coloured blooms of George W. Childs, the richest-coloured of all varieties. The dark flowers of William Seward were plentiful, and of good size, and among the incurved sorts those of Baron Hirsch deserve particular notice. The collection, as last year, is surrounded by a good band of Pompon varieties, but at present these flowers are only partly expanded. The Pompon section is better represented in this collection than in most of the Parks.

Victoria Park.

In this park, situate a few minutes' walk from Cambridge Heath Station on the Great Eastern Railway, a collection of about 3000 plants is arranged in the house now familiar to visitors to the Chrysanthemums in this district. The quality of the plants in general is equal to the high standard that we have observed here for several seasons past, but they are a little later than usual. Arranged on either side of a span-roofed house, with a central path, the plants have been staged in as good taste as is compatible with a path from which the whole collection is visible at once. An objection to a winding path and groups of an artistic nature is taken on the ground that with such an arrangement it would be impossible to keep the visitors moving in anything like the convenient manner that obtains at present, and upon Saturdays and Sundays, when a wonderful number of visitors are present, the result might be that hundreds would be unable to see the collection at all. Miss Anna Hartshorn showed up particularly well here, and William Tricker, a first-rate flower when in good form, had capital colour, and was of large size.

An unusual number of plants of Mrs. C. H. Payne were remarkable both for the display they furnished as well as for the excellent quality of the individual blooms. Louis Bœhmer was very large, but the flowers were not quite developed. Orientalis, a variety in the way of and superior to the old Curiosity, was good, and looked uncommon, for it figures but little in the several collections. Mr. J. Laing, W. Holmes (splendid colour), Edouard Audiguier, Robert Cannell, Bouquet de Dame, Mons. Tarin, G. C. Schwabe, Mrs. E. W. Clarke, Florence Davis, Wm. Seward, and E. Molyneux, were all noted as good. Gloire du Rocher, which had exceptionally fine colour last season in this collection, though slightly less bright, is again more than ordinary colour. A variety now seldom seen, but one of fair quality when in very fine condition, is Novelty, and a plant with three or four large blooms attracted attention. The new Duke of York was in bud, and it is the opinion here that this variety is useless if the crown bud is "taken." Louise was in bud also, as well as Lizzie Seward, Hamlet, and Mr. W. Troy, the latter an average quality Japanese variety of lemon-yellow, sent out by Mr. H. J. Jones. Many other new varieties have been added to this collection, the result being that a visit will be the more interesting. Of incurved flowers, there will be a better display in about a week. At present Mons. R. Bahuant, Baron Hirsch, and a few of the earlier varieties are only in bloom. Since last season Mr. Gibson, who was superintendent at that time, has been succeeded by Mr. Norman, who with the grower, Mr. Large, is responsible for the display.

Fig. 66.—Bentham ia fragifera at Trelissick. (see p. 500)

Waterlow Park.

The charge of this very pleasantly-situated park at the summit of Highgate Hill has changed hands since last season, Mr. Curle, who has taken charge of the park at Southwark, being succeeded by

Mr. Jno. Pallett. During the growing season, the clearer air at this elevation is favourable to the Chrysanthemum in comparison to the districts in which others of the parks are situated; but considerable inconvenience is experienced in housing the plants, the only accommodation being that provided by several lean-to vineries and an old-fashioned conservatory. To the general visitors, perhaps, the pleasure of a visit is by no means impaired by such surroundings; on the other hand, the few remaining bunches of Grapes that hang above the plants have a curious fascination for them. The only advantage these houses offer to our mind is, that the plants are stood much below the level of the ground, and the blooms instead of towering high above the head of the visitor, are rather below than above his own level. The plants this season are very commendable, and such varieties as Eynsford White, Edwin Molyneux, Alfred Lyne, Etoile de Lyon, Miss Anna Hartshorn, Bouquet de Dame, William Cobbett, Mrs. G. Rundle, Mrs. Geo. Glenny, Mdlle. Louise Leroy, Vivand Morel, Golden George Glenny, and Amos Perry, had blooms of first order, whilst numerous others are likewise of considerable merit. J. Shrimpton, amongst the newer sorts, was observed in good style; and William Seward and Florence Percy, the latter a white Japanese, with pale lemon centre. Mons. R. Bahuant was the best incurved variety. We must not omit to mention the splendid show of summer-flowering varieties in the border outside the house, all the best varieties have been extensively planted, and a wealth of bloom creating a display approaching that obtained inside has only just been marred a little by the frost.

Mr. Pallett says that as many visitors have been to see the display of these flowers as he expects will view the later and larger-flowered varieties. The park is a few minutes walk from the Archway Tavern, Highgate, and not far from the Upper Holloway Station on the Midland Railway.

Mr. H. J. Jones', Lewisham.

The lateness of the Chrysanthemum season is as evident at Mr. Jones' nursery at Hither Green, Lewisham, as anywhere. "We are a fortnight late," were the words with which we were greeted by this enthusiastic and successful grower. Nevertheless, there were many novelties already in bloom and on the point of opening, though some hundreds of plants rich in new varieties had not yet commenced to break their buds. Although this is a comparatively young business, it has grown unusually fast, and the number of trials, by which we mean the number of so-called novelties hailing from the Continent, Japan, and America, that are tested annually is remarkably large. Anyone who takes much interest in Chrysanthemums has some idea of the work this necessitates, and perhaps also of the very small percentage of real acquisitions which are to be obtained from the "new and startling" varieties that reach this country. However, it must be presumed that sufficient prizes are found amongst the bran to compensate the outlay, or it would not be continued. Regarding the collection on the whole, and in respect to the display it will furnish at the nursery, we found that the show will be made in the same house as last year, and the plants are staged in the same manner, with a winding path through the centre, an arrangement that met with frequent admiration last season. Prominent among the novelties is the excellent lemon-yellow Japanese Duchess of York. It was raised by a gardener in Scotland, and is already certain of a very large sale. The blooms on Mr. Jones' plants were not quite expanded, but some excellent flowers were exhibited at the Drill Hall on Tuesday last, and noticed in our report. Thomas Hallyer is the name of a rather loose-flowered Japanese from Italy. The florets are bright crimson, with dull silver reverse. It strikes one as likely to make a good exhibition flower another season. M. Martignac is a new yellow incurved, a small flower, but sufficiently good for a collection. Hairy Wonder was quite a novelty last year, but it will be exhibited in splendid form this season. There are numbers of plants here, and they furnish splendid flowers in size and build much superior to any other hirsute variety, and the plant appears to be a capital doer. Novelties of this section are likely to be plentiful this year, and we noticed a yellow one from Japan named King of Ostrich Plumes that may turn out good, but requires more time to tell. Souvenir de l'Ami Coyè is a hairy white flower, with pale yellow centre when opening; it is a better grower than Mrs. A. Hardy, but whether it will prove an improvement on White Louis Bœhmer is not certain. Lady of the Lake, as seen in a partly-developed flower, will differ in colour from Hairy Wonder, perhaps be heliotrope. Turning from the hairy section, Phœbus is the name of a slightly-reflexed Japanese of a very pleasing yellow. This is the first year, and it has three good blooms on a plant; the florets have great substance. Mr. W. Wright is an English seedling, a little like Belle Paul; the florets are rose-and-white, and are pretty. Mrs. W. H. Lees is known already a little, and was one of Mr. Jones' seedlings last year; it resembles Puritan, but is of extraordinary size, and has been certificated by the National Society. An incurved Japanese is the Duchess of Wellington, another English seedling; it has good, long, rather stiff florets, of a decided yellow. W. G. Newitt will make a good white Japanese; very deep flower. A little similar to Mrs. F. Jameson is a variety called Flood, but of better colour; and Lady Randolph, a Lewisham Seedling, is an incurved Japanese of specially good habit. The colour is rose, with silver reverse. A variety with curiously-twisted florets, has been appropriately named The Maze; it is rose-coloured, with silver reverse, and to our mind is too contorted in appearance. A white incurved Japanese with loose flowers, is Lady Smith, very meritorious, on account of its grand habit, generally growing less than 3 feet high. Mrs. E G. Hill is another incurved Japanese, the flower is of much excellence, and the delicate flesh colour is very attractive. It was certificated recently by the National Society. We must now mention a really fine Anemone-flowered variety named Descartes, from France. The outer florets open a very deep crimson, which fade a little after a time, and the centre has a yellow or bronze cast. This is the best deep-coloured variety of any Anemone-flowered we remember to have seen. Madame Carnot is not yet in flower, but the buds on a plant here are stronger than any in the collection, and promise immense flowers. This variety was distributed by Calvat this year, flowers were seen at the Aquarium last year and certificated. It is supposed to be the largest white one of all, is very pure, and florets are long and drooping. We may see some fairly good flowers during the autumn, but the plants were sent out very late, and this will be prejudicial. The last one we can notice on this occasion is Alice M. Lowe, a very pure white incurved Japanese. It is pretty, and the florets are broad, flower good and deep, but its chief merits are the purity of the blooms and its good habit.

SEASONABLE NOTES ON FLORISTS' FLOWERS.

October is a busy month with the florists. The Carnation and Picotee require special attention this month, as all the layers must be removed from the parent plants, and be either potted up or planted out where they are to flower. We are doing both. I have a large number to plant out, and a greater number to pot up for next season's bloom. I hear from various sources that the plants, or rather layers, have not formed roots freely this autumn. Where they were layered early this is not the case, as they have formed roots freely on our early layered stock. Many persons do not begin to layer their plants until the bloom is nearly over, and in a late season this is disastrous to the future of the plants. Any scarce and valuable varieties should be layered without considering too much whether the bloom is to be slightly injured thereby, but I do not think it is materially injured. The flowers seem to open as well upon layered plants as upon those that have not been layered. I would advise all those who have a considerable number of plants to operate upon to begin layering about the middle of July, as the layers generally form roots well from the middle to the end of that month, and very much more slowly after the middle of August. They will not do much in the way of forming roots after the middle of October unless some roots have been formed by that time, but those that are formed will continue to grow when the weather is mild. When the old stools have to be removed in October the unrooted layers may be taken off, potted in sandy soil, and the small pots plunged to the rims in a gentle bottom heat. Roots will form more rapidly in this way than if the layers were left upon the plants in a cold position. Complaints are made this season about "spot." This sadly disfigures the plants in some districts, and there does not seem to be any cure for it. If the plants pass through the winter without losing their foliage they generally recover again when growths begin in the spring. The rush, as some growers term the Helminthosporium which live upon the leaves, does not depart either in winter or summer, but it can be got rid of by constant watchfulness. The spots must either be rubbed out by the fingers, or the leaves attacked should be cut off, regardless of the appearance of the plants. Growers were much frightened when it first appeared in collections, and it is certainly very destructive if not taken in time. Plants in frames, as soon as they are well established, require plenty of ventilation; tilt the lights well in inclement weather, and pull them off altogether when the weather is mild. The Carnation, like all hardy plants of this kind, succeeds best in an open position, and protecting them at all with glass lights is a necessary evil. I find the plants put out now or early in November in the open borders grow more strongly and flower better than those planted in the spring. *J. Douglas.*

The Week's Work.

THE FLOWER GARDEN.

By John Lambert, *Gardener, Powis Castle, Welshpool.*

SWEET BAYS AND MYRTLES—Specimen trees of these, and Orange and Lemon trees and bushes, ought now to be brought under cover, and if convenient, put into their winter quarters. Occasionally before winter sets in, it is good practice to prevent an untimely casting of the leaves, to syringe them heavily. American Aloes (Agaves), and tender succulents which may have been grown for effect in the garden or on terraces, should now for safety's sake be placed where frost will not injure them. Afford all of these plants as much air as possible after housing night and day whilst it is not frosty.

HUMEA ELEGANS.—Plants may be growing very strongly, and in that case they will require a shift before the winter sets in, doing this before the roots become much interlaced, or as it is called, pot-bound. Failure to do this causes the loss of their lower leaves, and spoils their symmetry and beauty. Keep the plants in a cool greenhouse near to the roof-glass, and do not let them lack water at the root. Humeas like sandy loam; a small quantity, say, one-sixteenth of the whole, of decayed manure, and firm potting; and not less than one inch space left for the holding of water.

PÆONIES.—Where the increase of the stock of any variety appears desirable, the present is a good time for dividing the roots. When they have occupied the same spot for a long time their removal is generally an advantage. At the same time division may take place. The new position for the plant should be dressed with fresh loam and manure, and be well trenched if the land admits of it.

LILIES OF THE VALLEY, SOLOMON'S SEAL, MONKSHOOD, and **FLAG-LEAVED IRISES,** may be divided and replanted, but should not be exposed to the air longer than can be avoided.

LILIES.—Beds or clumps of Lilium candidum or L. tigrinum, which may not be quite satisfactory, should be examined at once, and if an increase of the stock of either is desirable, the younger bulbs should be removed, and planted in a bed by themselves. Should signs of rot appear at the base of the old bulbs, the ground should be drained in some manner, or a fresh position found for them. A light and porous soil, and if sandy so much the better, suits these, and most species of Lily, for it is readily enriched. The position should be a sunny and sheltered one, and above all, well drained. The bulbs may be planted in lines if in beds, the distance between the lines, and also from bulb to bulb, to be determined by their size, but it should not be less than 6 inches for the smallest. When cutting out the furrows with the spade, let them be of sufficient depth to allow of a layer of rotten manure, with another layer of soil and sand over that, upon which the bulb will set. The ordinary soil may be closed round and over them, to a depth of 4 inches.

GENERAL WORK.—This will consist of refilling beds and sweeping lawns, as, owing to the mild weather, the grass is still growing. Clean gravel-walks, put the grass verges in proper order. Shrub borders should be hoed, and the weeds cleared off. Summer varieties of Chrysanthemums that are not yet in flower may be taken up from the open borders or beds, potted, and stood indoors. These will furnish cuttings for next year's planting.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

PRUNING ORCHARD TREES.—Make effort to carry out the above at an early date, especially if the trees are young. All the varieties of a loose and too-spreading habit of growth as the following varieties, amongst Apples, Brabant Bellefleur and Peasgood's Nonsuch have long branches, these should therefore be shortened sufficiently so as to give more compactness to the crown, fruits on long slender branches being very liable to be shaken off or whipped by the branches in windy weather. Remove many of the weaker branches in any crowns which may be crowded in the middle. If time can be spared for the pruning of old orchard trees, the same directions will serve, and if the work be finished whilst the weather is mild, the wounds will heal more quickly than is the case with those made in the winter. It is well to remember that all cuts made with a saw should have the surface made smooth, especially the jagged bark. The long-handled tree-pruner is an excellent instrument for shortening back the long branches out of easy reach by means of a ladder.

RASPBERRIES AND BUSH FRUITS.—Where new plantations are going to be planted during the present season, the land should be forthwith prepared, heavily manuring and trenching it where Raspberries and black Currants will come. In light soil it does much good to remove some of the staple and replace it with retentive loam. In retentive soils that are not shallow, black Currants and Raspberries will afford good crops for many years with annual manurings, but in those of the opposite nature a few years' cropping exhausts them, and another quarter must be planted. For red Currants and Gooseberries the land should also be trenched, but unless it be very infertile, manure will not be needed at first, or over-luxuriant growth rather than fruitful shoots will be the result.

THE FRUIT ROOM.—For a few weeks to come the fruit-room should be well ventilated, especially during the night; one of the objects of so doing being to lower the temperature as much as possible. This is all the more important where many soft-fleshed Apples like Warner's King, the Codlin tribe, and others similar are stored, such varieties keeping but for a short time after being stored if not kept very cool. If this temperature should prove too low for the proper ripening of dessert Apples and of the Pears, Marie Louise, Doyenné du Comice, and Brown Beurré, some of these fruits should be put in boxes and removed to a warmer place, thus affording a longer season for them. A vinery where late Grapes are hanging is a very suitable place for Pears whose ripening has to be hastened. The fruit in the fruit-room will require frequent examination for a month from the present time, so that no rotting fruits may escape notice.

THE KITCHEN GARDEN.

By Arthur Coombes, *Gardener, Himley Hall, Dudley.*

RHUBARB.—As soon as the leaves and stalks of those roots which it is intended to force part easily from the crowns, clear them away. By doing this, the crowns are better exposed to the sun, and become well matured sooner than would otherwise be the case. A number of roots may be lifted for the earliest lot, and left on the surface exposed for a period of three weeks, or thereabouts. The best early variety is Johnston's St. Martin's, because it forces readily. The action of the frost on the roots completes the ripening process, and as a consequence the stalks show freely when forced. As a place to force Rhubarb, a warm cellar or the Mushroom-house, if in use, will bring them on nicely; but if the produce is required quickly, a higher temperature and a considerable amount of humidity may be afforded.

SEA-KALE.—Like Rhubarb, this plant requires the crowns to be thoroughly ripened; but the present season favouring late growth in the plants, the leaves cannot be readily detached before a sharp frost or two have occurred. If very early produce is looked for, some of the ripest crowns in the plantation may be lifted and laid in, in an open part of the garden, leaving the crowns and about 2 inches of the root ranging above the ground, which is a better method of maturing them than leaving them wholly uncovered, too much drying of the roots being detrimental.

CELERY.—No time should be lost in finally earthing and banking-up the early crops. The late Celery may receive additional soil from time to time, as the leaves grow out of that previously added.

BRUSSELS SPROUTS should have all the lower leaves cleared away, thus admitting air to the plants, and removing those which have an offensive smell. In some gardens it may be advisable to cut the Sprouts when gathering a dish, leaving a few eyes at the base of each to furnish small greens in the spring.

CAULIFLOWERS IN COLD FRAMES.—The potting of the plants may not be longer delayed. The sizes of pots which are most suitable are large 60's or small 48's, the soil chiefly loam, and the potting to be firmly done. Do not let them stand far from the lights, and ventilate freely at all times when there is no frost. In very severe frost, some litter or double mats will afford them all needful protection.

FRUITS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

CUCUMBERS.—The plants which are to give winter fruits will now require a temperature of 65° to 70° by night, and 75° to 80° by day. Ventilation must be carefully regulated in accordance with the weather, admitting air by the upper openings in the daytime. The bottom-heat from whatever source should be kept steady at about 78°. Cucumber plants which were planted out or put into their fruiting pots early in the last month, should now be showing plenty of fruit, and endeavours should be made to maintain the foliage sturdy by affording air in mild weather and by avoiding too much moisture in the air by damping down, &c., when the light is on the wane, or the shoots will be drawn, and unhealthy, and the fruits deformed. Crop lightly, so as to enable the plants to perfect a succession of fruits, heavy cropping now being opposed to good crops later on. The male blossoms should mostly be removed after making use of the pollen in impregnation; lateral shoots should be stopped at the first joint, allowing the main shoots to grow without stopping. The supply of water to the soil must not be overdone, a mean being struck between drought and wetness, but sufficient should be afforded to keep the roots growing steadily; and occasional light dressings of loam and manure should be placed all over the beds, pots, or hillocks. In using means to kill aphis at this season, do not fumigate, the foliage being too susceptible to injury, but make use of Quassia-water; and as against red-spider or thrips, sponge the leaves with lemon-oil mixture; and if mildew should appear, dust it over with flowers-of-sulphur.

TOMATOS.—The fruits for winter supply should now be in a forward condition, a steady temperature of 60° to 65° should be kept by night, and a little air admitted in mild weather; and by day it should range 70° to 75°, with abundance of air in mild weather. Much root watering will not be needed, but rather keep the soil on the dry side. Those plants that may be growing in pots will require more water than those which are planted in beds of soil, still it must not be excessive in amount. When the leaves of Tomatos are of a deep green tint it is a sign that the cultural conditions are right. All side-shoots may be removed from plants that are kept to one stem; and the fertilising brush used freely every day to the plants showing flower. If the Aleyrodes-fly is very troublesome, fumigate the house, it will not injure either the plant or fruit.

ORCHARD-HOUSE.—The potted trees that were placed out-of-doors should now be pruned, repotted, and trained. Those which are not repotted should have the drainage put in order and be surfaced with fresh loam and manure, after picking out a good quantity of the old soil. Pot newly bought young trees in strong turfy loam, mixed with mortar rubbish and crushed half-inch bones. Let the pots be quite clean, and the drainage good. Having finished these operations, remove the plants to their winter quarters where the roots will be safe from frost, the heated orchard-house being the best place for them, covering the pots with stable-litter or dry bracken. Trees that are planted out in the borders of the orchard-houses may be cleaned, pruned, trained, and put in good order generally; and those that are growing very strongly replanted.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton, S.W.*

THE POTTING OF PLANTS FOR FORCING.—The Continental supplies of these plants are now arriving, and can be purchased of our nurserymen. Azalea indica, though usually bought as potted plants, should nevertheless be repotted, as I find this operation has seldom been satisfactorily done by the foreign workmen. The potting-soil should consist of sound peat, a small quantity of fibrous loam, and plenty of sharp silver-sand, and the soil should be firmly rammed down round the ball, so that the water may not pass more freely through the new than the old soil. It is a very important point to have good drainage in the pots. The mollis and Ghent Azaleas being less fastidious than indica as regards the soil, less peat may be afforded, and more loam and sand, as well as lime rubbish; and a similar compost will be required by Lilacs, Staphylea colchica, Prunus sinensis, Japanese Maples, Genistas, Pernettyas mucronata, and Viburnum Tinus, all of which, when potted, should be plunged in coal-ashes, with the exception of Azalea indica, which should be placed in a structure from which frost can be excluded, A good deal of ventilation should be afforded these plants, and if the structure is a pit, the lights should be kept off them, unless heavy rains or frosts are experienced. The almost indispensable Lily of the Valley, if bought as clumps, should be placed partly in boxes, packing them round with some good garden mould, and partly in pots; the latter being selected from the stronger clumps. It may be as well to mention here that for very early forcing the strong crowns are much more trustworthy than clumps, affording immense bloom-spikes even when forced early. They require plenty of water. For Lily of the Valley, the pots may be 5 and 6-inch, and in these twenty-five to thirty-five crowns may be placed, according to size and quantity of roots. Cocoa-nut fibre refuse should be used about them, pressing the crowns very firmly into this somewhat soft material, which forms a good rooting medium, and is less liable than soil to become soured from frequent waterings.

RHODODENDRON HYBRIDUM.—These plants, whether taken from the reserve garden or purchased, may be either potted forthwith, or planted temporarily in some convenient place, where they may be taken up when required. It is not advisable to place these plants in pits, as if not very abundantly ventilated, the leaves assume a sickly hue, and drop, to the great disfigurement of the plants.

BEGONIA GLOIRE DE SCEAUX.—This useful plant, now coming into flower, should be afforded quarters in a warm-house. Stood amongst Ferns and small Palms, &c., it adds interest to the display. Liquid manure should be afforded the plants freely, if they are grown in small pots and are well-rooted. Another valuable variety, although less free to flower, is B. pictavensis; this plant lasts a long time in bloom, and is greatly admired on account of its pretty flowers, which are of a soft pink colour.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Letters for Publication.—*All communications intended for publication, as well as specimens and plants for naming, should be addressed to the* **Editor, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.*

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

Newspapers.—*Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

FRIDAY,	Nov. 2	Dundee Horticultural Association.

SHOWS.

WEDNESDAY,	Oct. 31	Kent County Chrysanthemum (two days).
THURSDAY,	Nov. 1	Highgate and District Chrysanthemum (two days). Chudleigh Chrysanthemum.
FRIDAY,	Nov. 2	Crystal Palace Chrysanthemum. Havant Chrysanthemum.

SALES.

MONDAY,	Oct. 29	Dutch Bulbs, at Protheroe and Morris' Rooms. Plants, at Protheroe & Morris' Rooms. Clearance Sale of Nursery Stock, at Frettingham Nurseries, near Nottingham, by Protheroe & Morris (four days).
TUESDAY,	Oct. 30	Dutch Bulbs, at Protheroe & Morris' Rooms. Nursery Stock, at the Nurseries, Ninehams Road, Upper Caterham, by order of Mr. G. T. Sedgley, by Protheroe & Morris. Twelve Freehold Farms and Farmhouse, situate at Whitstable, Kent, at the Mart, Tokenhouse Yard, by Protheroe & Morris.
WEDNESDAY,	Oct. 31	Dutch Bulbs, at Protheroe & Morris' Rooms. Sale of 100,000 Fruit Trees at Perry Hill, Cliffe, near Rochester, by order of Mr. W. Horne, by Protheroe & Morris.
THURSDAY,	Nov. 1	Sale of Nursery Stock and Fruit Trees, at the Hickmandias Nursery, Knockholt, Kent, by order of Mr. A. Waterman, by Protheroe & Morris. Dutch Bulbs at Protheroe & Morris' Rooms. Dwarf Roses and Continental Plants at Protheroe & Morris' Rooms.
FRIDAY,	Nov. 2	Orchids, at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.
SATURDAY,	Nov. 3	Dutch Bulbs, at Protheroe & Morris Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—46°.

Vegetables.

Professor Henslow's lecture at the Royal Horticultural Society on Tuesday last was an excellent example of a "popular lecture." He did not indulge in the romantic inaccuracies and misleading statements, which fluent but half-informed lecturers delight in, but he gave within the time-limits at his disposal an excellent summary, brimful of information, clearly explained, and even fuller of fruitful suggestion. After a brief survey of the nutritive value of vegetables, and after showing on what circumstances that value depends, the lecturer passed in review certain selected illustrations, such as the Turnip, the Radish, the Cabbage, the Potato, &c. The general history of these plants was sketched. Of some the origin is lost in obscurity, of others the source is well known. The methods of "ennobling" the wild plants by continuous selection and cross-breeding were illustrated, and attention called to the very curious, and at present unexplained, circumstance, that some plants are very variable, whilst others nearly allied and growing under like circumstances are relatively stable and immutable. The plants yielding our cultivated vegetables belong to the former class. Speculative reasons for the difference are very interesting, but hardly appropriate in this place. Suffice it to say, that it is very probable that the apparent stability is due for the most part, if not entirely, to want of adequate experiment on our parts rather than to constitutional inability to change. Having come into the possession of Wheat and Vines, and oil, of Cabbages, Potatos, and pulse, we continue to grow what our forefathers grew, and find them so good that we are little tempted to make experiments with new material, and work on similar lines over to those adopted by our forefathers. But this is selfish and wasteful on our parts, selfish because we show ourselves willing to avail ourselves of what our ascendants did, but are not so ready to confer similar benefits on our descendants; wasteful because we allow the riches which are prodigally bestowed upon us, or which are at least within our reach, to be left unutilised.

Of the hundreds of thousands of plants, we utilise only a few scores. Can any one doubt that a vast number more might be turned to account? Can any physiologist or experimentalist who sees and knows what has already been effected with a few plants, have the least doubt that far more might be done in the future? Depend upon it, it is not the so-called fixity and stability of plants that keeps us so closely in one groove. We do not deny that some plants are more stable than others; but we do assert that the chief obstacle to progress resides in apathy, prejudice, and ignorance. Now that there are symptoms which show that the principles as well as the practice of gardening will be taught in our technical schools, we may hope for more marked advance in the future.

Training Chrysanthemums.

Various are the methods practised of training Chrysanthemums for the production of large blooms. In referring to the different methods in vogue, our remarks will be confined to those plants which are grown for furnishing large blooms for exhibition or other uses, and not to trained specimen plants.

Some cultivators top the plants when 8 inches high, whilst they are standing in cold frames, even when they have been struck and grown on in their first stage in a cool house. Three branches are generally selected by these operators, the result of the topping, all others being promptly removed. The shoots are trained outwards to several stakes, so as to give them increased space and light. The second bud forming is selected for the production of the blooms which are generally large, but owing to the wood not being thoroughly ripened, consequent on the late topping and the growths being behind their natural stage, these are not of first-rate quality, and lack the essential points that an incurved bloom should possess, viz., depth and solidity. One cultivator, especially, who practises the system here detailed, has been an exhibitor for the last twelve years, but has never taken a leading position where the competition was keen.

So much then for such a method as that described. With a view of reducing the height of certain varieties (Prince Alfred, for instance), a Liverpool cultivator tried the following plan eighteen years since. He was a successful exhibitor, too. The point of each plant was pinched-out at 4 inches high. This induced the production of several shoots; two of the strongest were selected and tied to a stake, and allowed to extend till the first natural break, and from this break two other shoots were carried up. The plants thus produced four blooms each. The plants in question grew to a height of 8 feet. Therefore, the object aimed at was not gained. This variety has, to our knowledge, grown to the abnormal height of 12 feet in some seasons. Another plan of reducing the height of the plants is the following:—Some growers in the early stages starve them by withholding water, and also allowing them to become root-bound previous to shifting into larger pots. The effect of such treatment certainly reduces the height of the plants, but the flowers produced are rarely of the first order of merit, being generally small and lacking depth of petal, and consequently solidity and symmetry. A plant rendered constitutionally weak by starvation cannot produce flowers in perfection.

There are persons who both advocate and practice the method of growing the plants with but one stem, or at the most two, not topping them at all, but allowing them to make the customary breaks naturally, restricting the number of shoots each time to those stated. All other conditions being favourable, good flowers are produced by such plants, but the practice is a wasteful one, as one plant will produce more flowers of equally good quality. In fact, the Bahuant, for example, will give six better blooms from one plant than it will three. This is a notable variety in that respect, three blooms being the orthodox number to take from each plant where all points of quality are expected and desired.

Some nurserymen recommend late propagation of the plants. Exhibitors and cultivators generally prefer early propagation, say the month of December for taking the cuttings, to February or March as some advise. Instances do, however, occur, of an individual example or two in a collection giving a bloom equal to any of the plants struck earlier, but so rarely does this occur, that the system has little to recommend it as a finality.

As a general system for producing the best results, and taking the various kinds of weather we have to contend against during the different seasons that affect the growth of Chrysanthemums, it is best to allow varieties to assume (with but one or two exceptions), their natural habits, the growth is then solidified, and all the wants of the plants met at the proper time. The plants are not topped at all, but allowed a free uninterrupted growth until the first natural break, which occurs at various times from early April to the same time in June, according to the variety, the time the cuttings were inserted, and the manner in which the plants have been managed since. Some tall-growing varieties will reach 4 feet before they make their first break, while others pass through this stage when but 18 inches high. No absolute rule can be laid down as to the time of the first natural break; when it does occur, the bloom-bud must be rubbed out and three of the strongest shoots selected. These must be securely tied to a stake as they grow, as they are brittle, and likely to be damaged.

All side shoots which are made from time to time should be promptly removed, so as to concentrate the whole energy of the plant in the selected shoots, thus giving them all the support possible.

This phase of culture is not the work of a few weeks, as some would have us suppose, when the topping practice is adopted, in May, June, and July, for instance, as we are led to believe. The wood of Chrysanthemum plants must possess solidity, the result of timely maturation, to give us the incurved blooms which not only win prizes, but stand as examples of methods practised and advised. No cultivator ever gathered perfect examples of this section from ill-ripened, softly-grown plants. It is in the production of this type of blooms that the greatest skill is needed, and the best systems necessitated.

an alphabetical index of Latin and Greek terms, with the synonyms of each, in four modern languages (Haarlem de Erven Loosjes). The result is a reference-book likely to prove very serviceable to both readers and writers, when at a loss for the correct equivalent of some foreign word, which, should they have recourse to a more bulky general lexicon, might prove from its technical nature to be therefrom excluded, and the seeker's labour in vain. The book is dedicated to Mr. Th. S. Ware, of Tottenham, and contains a short preface by M. Fr. Crépin, Director of the Brussels Botanic Garden. Some rather curious Latin words are inserted which we do not find in our Dictionary, such as *unatus, utilus, varitwelve new varieties (cut flowers) of Dahlias, single blooms (*par acclamation*) to M. François Desbois; for Cattleya Schilleriana (*par rappel*) to M. J. Hye; also for Cypripedium Albertianum (*par rappel*), Cattleya labiata autumnalis var., Odontoglossum grande var., and Cattleya exoniensis, all from the last exhibitor; and for Cattleya guttata pernambucensis from M. le Marquis de Waverin. Honourable mention for novelty and variety was awarded for Cypripedium Pollettianum (calophyllum × œnanthum) from M. Ed. Pynaert; for C. Madame Emile Gayot (Harrisianum × Chantini) from the same exhibitor; and for two tuberous Begonia striata from M. Jean de Kneef.

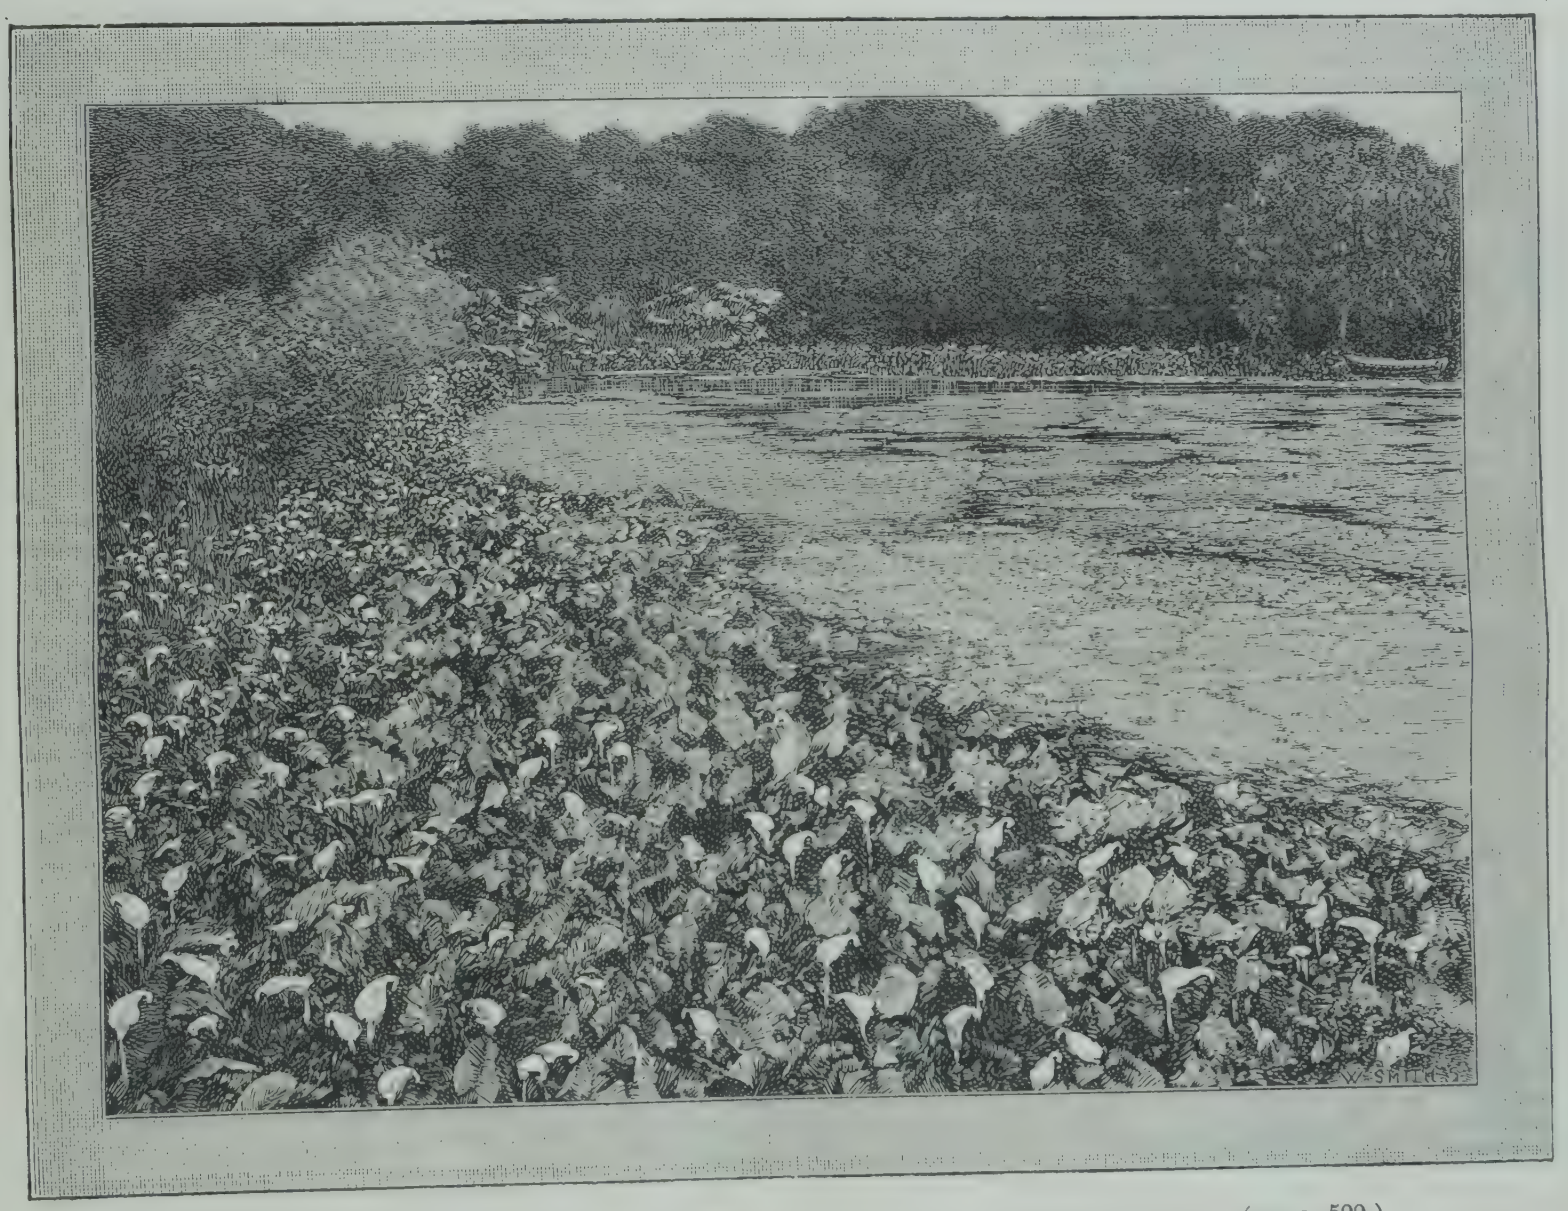

Fig. 67.—the lily pond, trelissick, bordered by white arum and japanese primroses. (see p. 500.)

Linnean Society.—The first meeting of the Session 1894—5 will be held on Thursday, Nov. 1, 1894, at 8 p.m. precisely, when the following papers will be read:—1. "Contributions to the Knowledge of Monocotyledonous Saprophytes." By Percy Groom, M.A., F.L.S. 2. "On an Error in the Descriptions of the effect of a Centrifugal Force upon Growth." By Rev. G. Henslow, M.A., F.L.S. 3. "On Mediterranean and New Zealand Retepora, and a fenestrate Bryozoan." By A. W. Waters F.L.S. Fellows having objects for exhibition on that evening are requested to communicate previously with the assistant-secretary, that their names may be placed on the agenda paper and in any preliminary announcements which may be sent out before the meeting.

A Useful Book.—Under the title *Dictionnaire Latin (Grec), Français, Anglais, Allemand, Hollandais, des principal Termes employé en Botanique et en Horticulture*, Mr. Jongkindt Coninck has published *catus, versiflorus, arciticus;* while England is not the equivalent of Britania. Some of these are misprints, and do not materially detract from the utility of the book; but as a second edition is likely to be called for, it may be useful to suggest that the proofs be carefully read by more than one person, and of different nationalities. In the meantime no commercial man doing business in either of the countries named can dispense with this publication.

Ghent Royal Horticultural Society.—At the recent (October) monthly meeting of the Chambre Syndicale des Horticulteurs Belges, and of the Royal Agricultural and Horticultural Society of Ghent, the following awards were made: Certificates of Merit for Lavatera arborea fol. var. to M. Louis Demeyer; for Cattleya Proserpine (Lælia Dayana × Cattleya velutina) to M. J. Hye; for a double-flowered tuberous Begonia, Madame Armand de Meulenaere (*à l'unanimité*) to M. J. de Kneef; for twelve new varieties (cut flowers) of Dahlias, single blooms (*par acclamation*) to M. François Desbois; for Cattleya Schilleriana (*par rappel*) to M. J. Hye; also for Cypripedium Albertianum (*par rappel*), Cattleya labiata autumnalis var., Odontoglossum grande var., and Cattleya exoniensis, all from the last exhibitor; and for Cattleya guttata pernambucensis from M. le Marquis de Waverin. Honourable mention for novelty and variety was awarded for Cypripedium Pollettianum (calophyllum × œnanthum) from M. Ed. Pynaert; for C. Madame Emile Gayot (Harrisianum × Chantini) from the same exhibitor; and for two tuberous Begonia striata from M. Jean de Kneef.

The Botanical Society of America.—Under this title, a new Society (says the *Botanical Gazette*) has been established, consisting of American botanists engaged in research, or who have published work of recognised merit. The election into this Society is thus somewhat strict. Professor Trelease has been elected President; Dr. N. L. Britton, Vice-President; C. R. Barnes, Secretary; J. Donnell Smith, Treasurer. Professor Sargent and Professor G. L. Greene are elected additional members of the Council. The first annual meeting will probably be held at Chicago.

French Horticultural Congress.—The Société Nationale d'Horticulture of France is organising, in connection with the Paris Horticultural Exhibition of 1895, a Horticultural Congress to be held in May next at the same time as the great show. The following are the subjects proposed for discussion:—1, The part played by chlorophyll in

plants, and the remedies for chlorosis. 2, The cultivation of forced Vines under glass, in France and other countries. 3, The outward appearance of fruits and tubers as indicating their quality. 4, The heat of the sun or that of the air; which has most influence on vegetation? 5, Grafting Potatos. 6, Apparatus for warming glass-houses and consuming different fuels (wood, charcoal, petroleum, gas, &c.). 7, The advantage of a fixed standard for regulating the different systems of hot-water heating. 8, The various modes of growth in plants obtained from seed, Palms more particularly.

Radishes.—There is a very suggestive article in the number of the *Revue Horticole* for October 1, relating to the depth at which Radishes should be sown. In the figures given by M. Alluard the great advantage of sowing the seed at a depth of 4 cent., say 1½ inches, instead of 2 cent., say half an inch, is clearly shown. The Radishes at the greater depth are longer, more shapely, and better in all ways than those less deeply covered by soil. This applies to the long varieties. The Turnip Radishes are sown at a depth of 2 cent., and require the soil to be beaten down.

The Missouri Botanical Garden.—This Institution, designed eventually to fulfil for St. Louis and the State of Missouri the same sort of work that is accomplished here by Kew, owes its origin to Mr. Shaw, an Englishman, long settled in St. Louis, and who left considerable property for the purpose. The legator also arranged that an annual banquet should be held for both botanists and gardeners, and that a flower-sermon should be preached once a year, so that the souls and bodies of the gardening community shall alike be benefited. The fifth annual report is before us, containing an eloquent and appropriate sermon by Bishop Dudley, a report of the work done in the garden during the year, as also a note of the banquet aforesaid. The scientific papers by Dr. Trelease, the Director, and others, include "Monographic Sketches of the American Willows, Maples, and other Plants."

North of Scotland Horticultural and Arboricultural Association.—The members of this association held their first meeting of the session in the Christian Institute, Aberdeen, recently, Mr. J. Munro, the president, in the chair. A discussion took place as to the means that should be adopted to interest a wider circle in the proceedings of the association, and it was ultimately resolved to organise classes for young gardeners for the study of botany and other subjects during the winter.

Pereskia aculeata.—We learn from our valued correspondent, "F. W. B.," that this plant is now flowering profusely in one of the warm plant-houses in the College Botanical Gardens at Dublin, where it forms a rambling shrub 15 to 20 feet high. The lower part of the slender stem is ferociously armed with clusters of sharp spines, the upper portions being leafy and less prickly, whilst the slender terminal shoots bear lax panicles of soft creamy-yellow flowers not unlike Banksian Roses, but larger; and the ten perianth segments are more slender, inside which is a cluster of orange-yellow stamens, and a large five-parted white stigma. The waxy blossoms are deliciously scented like Philadelphus. This species is much used as a stock on which to graft Epiphyllums, but it does not appear to find favour as a flowering-plant on its own account, perhaps because it requires considerable space overhead with full sunshine, and must be of some considerable age ere it produces flowers. It is a native of the West Indies, where its fruits are known under the popular name of "Barbados Gooseberries."

The Surveyors' Institution.—The first ordinary general meeting of the session 1894 95 will be held on Monday, November 12, 1894, when the President, Mr. Thos. Chatfeild Clarke, will deliver an opening address. The chair will be taken at 8 o'Clock. The first of four meeting of examinees and students authorised (subject to certain conditions) by the council to be held during the present session, will take place in the lecture-hall of the institution, on Monday, November 19. The chair will be taken at 7 o'clock. All inquiries, with reference to the junior meetings, should be addressed to A. Norman Garrard, Esq., 8, Frederick's Place Old Jewry, E.C.

Illegitimate Exhibiting.—We cut the following from the report of a local flower-show, and whilst we regret the necessity, we can but be grateful to the committee for their firmness in dealing with the matter: "Since the annual meeting a prominent exhibitor has been proved guilty of showing contrary to regulations, and the declaration on entry-form, and has been expelled from this society. The member who aided in the infringement has also been debarred from any further connection with this society."

The Goose Flower.—The *American Florist* narrates that all the time this plant was known by its scientific name of Aristolochia gigas Sturtevanti, the Chicago people took no heed, but when a reporter for a daily paper called it the "Goose Flower," crowds came to see it in such numbers that special precautions had to be taken to secure order. Certainly the technical name, as a popular designation, is almost as objectionable in its way as is the odour of the flower; but why call so magnificent a blossom "Goose Flower?" Popular names are sometimes necessary, but they should be appropriate. We do not think Goose Flower is so.

"Fertilisers and Feeding-stuffs."—Such is the title of a useful little handbook addressed to the practical farmer by Dr. Bernard Dyer, and published by Messrs. Crosby Lockwood & Son. The earlier chapter deals with the terrible waste of fertilising materials, consequent on the way in which the farmer neglects the proper treatment of farmyard-manure. Artificial fertilisers are then treated of, such as nitrate of soda, sulphate of ammonia, guano, bone-dust, and other manurial substances, the proper application of which for different crops is duly explained. The text of the *Fertilisers and Feeding-stuffs Act*, 1893, is given.

Catalpa bignonioides.—Mr. G. Busby, gardener to Col. Willan, Thorn Hill Park, Bitterne, sends us a photograph of a noble Catalpa. It is 40 feet in height, with a girth at 3 feet from the ground of 10 feet. The circumference of the head is no less than 170 feet. It must be a glorious sight when in full bloom.

Cheap Orchids.—We read in the *Daily News* that Orchids are becoming cheaper in France. Our Paris correspondent says: What was worth twenty francs last year can be now had for five francs. Cut Orchids for table decorations, that cost five francs a flower last year, are being sold for one or two francs at the most. Orchids are greatly used to intermix with fruit on fruit dishes, and in specially-made baskets intended to figure at dessert. Orchids will also be employed in serpentine decorations, laid simply on the tablecloth. The Rose will hold its own in the drawing-room, cut with long stalks, and in porcelain vases. The Orchid is supplanting the Gardenia as a button-hole flower.

Flowering of Theophrasta Jussieui.—We learn from the *Illustrirte Garten Zeitung* for the present month, that a plant of the above has flowered in the garden of Prince Schwartzenburg, the flower-spike being shown by Mr. Bayer, the head gardener, at the meeting of the Vienna Horticultural Society, on September 10. It is a native of San Domingo, belonging to the natural order Myrsineæ, seldom seen in cultivation, and still more seldom does it flower. The flower-spike and a leaf were illustrated in the *Gardeners' Chronicle*, October 8, 1887, p. 429.

Weed-killer.—Dealers in horticultural sundries, not being qualified pharmacists, must take care that they do not infringe the law by selling poisons without a specific license. On the 10th instant a nurseryman at Putney was fined £5 for selling a gallon of "Weed-killer." This mixture, when analysed, was found to contain, as was stated at the trial, 2¾ lb. of arsenic, enough to poison 8,000 people. The necessity of enforcing an Act intended for the protection of Her Majesty's lieges is thus more than amply shown. A full report of the trial is given in the *Pharmaceutical Journal*, Oct. 13.

Fruit Exhibits at the Royal Horticultural Society.—At the ordinary meeting of the Society's Committees on Tuesday last, a resolution, proposed by Mr. T. F. Rivers, was carried unanimously by the Fruit Committee, that the Council be asked to consider the advisability of limiting exhibits of fruit to fifty dishes of any kind, and that no duplicates be allowed, in order to place growers on better equality than at present; also that the best varieties only may be placed before the public for educational purposes. Mr. Rivers maintained that such a resolution is in perfect accord with the established principles of the Society.

Chrysanthemums in Holland.—A large Chrysanthemum exhibition will be held at the Hague from November 1 to 5, and at Amsterdam from November 8 to 12.

Royal Seedsmen.—We understand that Messrs. Laing & Mather, nurserymen and seedsmen, of Kelso, have been appointed seed merchants and nurserymen to H.R.H. the Prince of Wales.

Thuia orientalis var. pendula.—The plant called in gardens T. pendula is so widely different in appearance from the ordinary Eastern Arbor vitæ, T. orientalis, that it is no wonder if some scepticism is felt at the determination of botanists. A specimen before us from Lord Powerscourt's estate is, however, conclusive, as with the habit and foliage of T. pendula it bears the cones of T. orientalis (Biota).

Japanese Birches.—Mr. Mitsutaro Shirai in the number of the *Japanese Botanical Magazine* for August 20, reviews the species and varieties of Betula occurring in Japan. Twelve species are enumerated, and descriptions of them are given in English, together with a sheet of illustrative sketches. Mr. Shirai describes one new species which he calls Betula globispica, by reason of its globular strobiles.

Tansy.—A correspondent in Southern Scotland, just north of the Tweed, tells us this plant is called in his district "Herb Waller."

Hybrid between Abies Pinsapo and A. Nordmanniana.—The August number of the *Journal de la Société Nationale d'Horticulture* makes mention of a cone of a hybrid Abies called A. insignis ×. The tree is interesting not only on account of its origin, but especially for its vigour and beauty.

Raspberries.—A recently-published *Bulletin* of the State Agricultural College of Michigan is devoted to a descriptive enumeration of the Raspberries of the United States. These are derived from the European Rubus Idæus, from the American Black-cap, Rubus occidentalis, and from R. strigosus, or as crosses between these species. About sixty pages 8vo are occupied with the list. Fortunately we could not make up quite such a long list.

Tree Ipomœas.—We are so accustomed to think of Ipomœas and Convolvulus as twining plants, that some surprise may be felt at the existence of Tree Ipomœas. The number of *Garden and Forest* for September 12, however, gives an account accompanied by illustrations of certain species found in Mexico. Mr. Rose of the Department of Agriculture, Washington, gives in the journal just mentioned a monograph of these trees. They are described as among the most beautiful flowering trees in Mexico, and being at present of no commercial value, are happily let alone.

Congenital Fasciation.—M. Hugo de Vries contributes an interesting article on this subject to the *Overgedrukt uit Botanisch Jaarbook*, in which he shows how, in certain plants, this monstrosity becomes constant for many generations.

HYPERICUM DENSIFLORUM.*

To Mr. W. E. Gumbleton we are indebted for a specimen of this very pretty little North-American plant. It forms dense tufts of erect, slender, wiry, angular stems, 2 or 3 inches in height; leaves numerous, spreading, about a quarter of an inch long, linear obtuse, recurved at the margins as though to prevent excessive evaporation. The flowers are borne on the ends of short leafy pedicels—each is about a quarter of an inch in diameter—with linear spreading dotted sepals, and yellow petals surrounding numerous delicate thread-like stamens. The massing of the numerous little flowers produces a very gay effect. The plant is quite hardy.

Fig. 68.—Bush of pear Beurré Baltet père: as grown in the nursery of Messrs. Jas. Veitch and Son's, at Slough. (see p. 367, sept. 29.)

* *Hypericum densiflorum*, Pursh.—Exceedingly branched above, 1 to 6 inches high, the branches slender, and crowded with smaller leaves; flowers smaller, ⅓ to ½ inch in diameter, and more numerous in crowded compound cymes; pod 2 to 3 lines long (three-celled with three styles). Pine barrens of New Jersey to glades of Kentucky, Arkansas, and southward. Gray, *Manual*, ed. 6 (Watson & Coulter), 1890, p. 93.

BELGIUM.

THE EXHIBITION OF DESSERT FRUITS AND DAHLIAS

This exhibition was held at the Exposition Universelle (Antwerp), on October 7, 8, and 9, and was very successful. The show of Apples and Grapes was excellent, as were the exhibits in general; partly owing to the fact that but few exhibits were included under each entry, and consequently only the best fruit was staged. The tables were tastefully decorated with Ferns and other foliage plants.

As to the plants shown, one of the best exhibits was a large group of choice species and varieties of plants for room and table decoration, arranged very artistically. There was also a fine collection of Bouvardias.

Chrysanthemum Show.

There will be opened on November 4, at the Exposition Universelle, an International Chrysanthemum Congress, coincident with the closing of the exhibition on the following day. Many entries are expected. Intending exhibitors, English and Belgian, should address their applications to the President of the Horticultural Section, 2, Rue Montigny, Antwerp.

Meeting of the Orchidéenne.

The last meeting of the Orchidéenne was noticeable from the numbers of Cattleya labiata Warocqueana and aurea that were staged. Dr. Capart showed twenty well-flowered specimens of C. Warocqueana, among which were many fine varieties.

L'Horticulture Internationale (M. L. Linden) staged a lot of C. aurea, very good, and including C. aurea Statteriana, the divisions of which were transparent nankeen yellow, the lip very large, with a broad band of pure yellow; other varieties were remarkable for the size and deep colouring of the lip; C. labiata Warocqueana was seen in full beauty; C. Hardyana Lindeni was noted for the translucency of the divisions, the extra deep colouring of the lip and its large spots of clear yellow; Lælio-Cattleya Lebrunana was seen with dark-coloured divisions, the lip much developed, and a peculiar dark purple; C. maxima marginata has a lip well marked, and bordered with white. Noticeable also were Lælio-Cattleya Cauwenbergiana with very clear colouring, and L. C. elongata dark in tint. Cypripedium Charlesworthi excellens is a variety with a much-developed lip of deep colouring. Worthy of being noted were the three fine specimens of Catasetum Bungerothi with large wax-white flowers (one cluster numbered thirteen blossoms); Odontoglossum crispum nanum shaded and lightly dotted with lilac; Cattleya maxima from M. Van Wambeke, the lip peculiarly marbled; C. labiata Warocqueana marmorata from M. Madoux, the divisions of it all well marked; two Odontoglossums from the same exhibitor were white, one large the other having sepals and lip spotted with brick red. Cattleya Aclandiæ from M. Van Wambeke had large flowers, the divisions deeply coloured. The same grower staged a good Cypripedium vexillarium, and a Cattleya gigas with a double lip; M. Madoux showed a C. gigas with mottled divisions; M. Miteau an unusually dark Cattleya labiata Warocqueana, and M. Van Wambeke a Cypripedium Argus, with petals bearing large black spots.

Orchids in M. Peeters' Houses.

We noted lately in M. Peeters' houses a fine Cattleya Hardyana with the lip well marked; and C. Schilleriana, with a well developed lip, very brightly coloured and edged with white. In one of the houses from three to four hundred specimens of Oncidium Forbesi were coming into flower; in a gallery with a sloping roof are hung fifteen hundred plants of Cattleya labiata, in excellent condition, all about to bloom. *Ch. D. B.*

ORCHID NOTES AND GLEANINGS.

AGANISIA IONOPTERA.

The above very distinct and pretty species is at present in flower in Lord Rothschild's collection at Tring Park. One plant has a spike of more than 1 foot in height, which bears twelve white flowers of wax-like texture, prettily marked with light purple. Each of the flowers is rather more than 1 inch across, and their arrangement is very effective.

Habenaria militaris and H. carnea.

These plants are also splendidly flowered at Tring Park, the stout spikes of the former bearing unusually large, brilliant vermilion flowers, while H. carnea has ten flowers of fine size and substance to a spike. The singular-looking H. Susannæ recently figured in the *Gardeners' Chronicle* has just passed out of bloom. *J. O'B.*

BERLIN.

A CACTUS SHOW.

On Sunday, October 14, we had here the first show of succulent plants, arranged by the Gesellschaft der Kakteenfreunde, which was founded two years ago by Professor Schumann, of the Royal Botanic Museum at Berlin. The number of exhibitors was not very large, but the exhibits staged by nurserymen as well as by amateurs showed that succulents, especially Cactaceæ, are very much liked here, and that the cultivation of these plants, although by no means easy, has reached a high degree of excellence. The illustrated *Monatschrift für Kakteenkunde*, of Professor Schumann, which gives abundant practical as well as scientific information in each monthly number, has done very much to forward this end. The amateur collection which won the 1st prize, was

that from Mr. Liebner, of Berlin. We saw among his plants very strong seedlings of Cephalocereus (Pilocereus) senilis, fine specimens of Mammillaria plumosa, Echinocactus MacDowellii (a novelty), Anhalonium prismaticum, Echinocactus cylindraceus, with fine long rose-coloured spines, and the closely-allied Echinocactus Lecontei, with white spines; both the latter very sturdy specimens, which showed that these two are, indeed, distinct species. Then there were the valuable Echinocactus ingens, E. polycephalus, E. Wiscliczenii, E. californicus, E. pilosus var. Steineri, E. hexædrophorus var. major, a form with prominent long prickles; Echinocactus robustus, and Echinocereus Engelmanni. Large specimens of grafted species were also exhibited by the same grower. The plants are grafted upon Cereus Spachianus, Cereus macrogonus, and some upon Cereus peruvianus. We remarked amongst these grafted plants a very fine specimen of Pilocereus Brunonis. Another amateur, Mr. Maul, of Lichterfelde, near Berlin, who won the 2nd prize, showed well-grown specimens of Pelecyphora aselliformis and P. pectinata, also of Mammillaria micromeris, and an imported specimen of Echinocactus Sandillon. Besides these and numerous other plants, he showed some capital and strong seedlings of Cereus pruinosus, Echinocereus ingens, Cephalocereus (Pilocereus) senilis, and other varieties. The best specimen Cereus was staged by a third amateur (Mr. Hirschl, of Zehlendorf, near Berlin). He also showed the best specimens of Echinocactus Simpsoni, cornifera var. scolymoides (=Mammillaria dæmonoceras). All these plants were cultivated in the dwelling-houses of the growers, together with a great number of other species of Cactaceæ. Certainly they must be judged from quite another point of view than the plants of nurserymen. Notwithstanding the condition, that the plants exhibited must have been under cultivation for at least one year, they were as well or even better grown than those of the nurserymen. But professional growers also exhibited some very fine and good collections. The largest lot which won the prize of honour was that from Mr. Benecke, formerly Hildmann at Birkenwerder, near Berlin. Another very fine collection of rarely-seen and well cultivated plants was from Mr. Mundt at Pankow near Berlin, who won the 3rd prize. He had wonderful specimens of Echinocactus Williamsi, formerly known under the name of Anhalonium Williamsii. Very fine specimens of Echinocactus denudatus were also exhibited by this nurseryman. A large collection of strong imported specimens, not for competition, was exhibited by Mr. Reichenbach, Cactus importer of Dresden, amongst them Anhalonium fissuratum, the Grusonia cereiformis, which is, as Professor Schumann says, a Cereus; then Echinocereus Merkerii, chloranthus, dasyacanthus, and the straw-coloured E. stramineus, Echinocactus texensis, E. Smithii, E. intertextus, E. uncinatus, E. Wrightii, with very long prickles, E. capricornis var. minor (novelty), and E. Schumannii, one of the most important and interesting modern importations from Paraguay. Mr. Friedr. Ad. Haage, junior. at Erfurt, the well-known Cactus grower, who has three times this year in Germany exhibited 500 species, had at this exhibition only some very strong seedlings of about the size of a hazel-nut of Cephalocereus (Pilocereus) senilis, which were from seeds sown last July. Besides these he had some fine specimens of Echeveria pulverulenta, and also of Mesembryanthemum tigrinum, the latter covered with large yellow flowers.

Succulent plants, such as Agave, Aloe, Haworthia, &c., were exhibited only in small quantities; the best collection was from an amateur, Mr. Urban at Berlin, who won a Certificate for them. I can here only mention the largest and finest collections, among these only the most remarkable specimens; but, notwithstanding this, it will be seen that this first exhibition was a very fine one. It may be hoped that it has gained a number of new supporters. *Our Berlin Correspondent.*

NOTES ON CHRYSANTHEMUMS.

Broadheath, Worcester.—The season of 1894 cannot be considered favourable to perfection in the incurved Japanese and Anemone-flowered varieties of the Chrysanthemum. Malformed buds are to be found in numbers in most collections, even those that have received the greatest attention. At the Heath Nursery, near Worcester, Mr. Maylett combines with the management of the local Post-office the pleasurable—if not always profitable—business of growing plants and flowers for market, ably assisted by his sons. The glass structures are of modest dimensions, and probably home-made, but some very good results are obtained in them. This year Mr. Maylett has about 6,000 Chrysanthemum plants, mostly grown for furnishing cut blooms; still a good many decorative plants, and a number for specimen blooms are also grown. Amongst the last-named, a dwarf, clean, robust lot, I failed to note any malformed or coarse buds; and the plants range in height from 3 to 6 feet, the greater proportion of them being about 4 feet above the soil. Grown in this way the plants are admirable for grouping, and some of the flowers will be probably good enough cut for exhibition, although that has not been the intention of the growers.

Mr. Maylett attributes the regular shape of the flower-buds—and, I think, rightly—to the avoidance of a too free use of manurial stimulants during growth. *J. U.*

Chrysanthemums at Lea Castle, Kidderminster.

Mr. Farrant, the gardener at the above place, makes a specialty of the Chrysanthemum, and his plants this year would gladden the eyes of the fancier. He grows them in three sections, viz., for large flowers, half specimen plants, and plants for supplying cut blooms. These gardens are so well managed that they deserve a much longer notice than is here possible; but I may say that Grapes and Peaches are of the first quality and quantity. The various kinds of plants cultivated are clean and healthy, vegetables good and abundant, and the extensive pleasure-grounds in excellent order. *J. Udale.*

Chrysanthemums in the Isle of Wight.

The Chrysanthemum is cultivated very generally by cottagers and amateurs, and next month there will be not fewer than six exhibitions; but, unfortunately, as I am informed, three of the largest and best clash with their dates, viz., Isle of Wight Chrysanthemum Society held at Newport, and Ryde, and Shanklin, which thus materially affects the number of the entries and the receipts at all of them. This unfortunate circumstance ought to be avoided in so small a place, where the population is only about 80,000. To give the greatest stimulus to cultivators the societies should amalgamate, and then offer prizes sufficient in amount to induce the exhibitors to come from a distance. The following varieties have in most parts of the island failed in the crown bud, viz., Mrs. C. Harman Payne, George Atkinson, and Golden Wedding. It would be of interest if Chrysanthemum experts would give through the medium of these pages their opinions as to the cause of crown buds failing in certain varieties. *S. Heaton.*

Chrysanthemums round Edinburgh.

The prospect of the Chrysanthemum season is now generally considered good here, the last seven weeks having been bright and dry, doing much to perfect the blooms and ripen growth. The absence of the gales usually experienced during the autumn has allowed the safe housing of these plants without the usual accompaniment of broken shoots, and the majority of the plants which have come under my observation promise to afford very satisfactory results. A visit to Trinity Cottage, Edinburgh, is always of interest to admirers of the Chrysanthemum, and although not an establishment where flowers are grown for competition, Mr. McMillan, the gardener, has always good plants and flowers. A visit made in May last afforded one an example of his successful efforts with these plants, when at that season many fine flowers were remarked, and the display has been kept up, and as might be expected, it is now finer than at that season. A small house is now full of flowering-plants, while others were in many different stages of development, the majority being grown for decorative purposes. The cut-back system in adopted very successfully, all the plants having a sturdy appearance. Amongst those were noted in full flower W. H. Lincoln, a variety of dwarf habit, whose large flowers are of a bright yellow colour; W. Tricker, with large, delicate, rose-coloured flowers; Viviand Morel, the drooping flowers of which are exceedingly attractive; Florence Davis, just opening its greenish-yellow flowers; Mrs. G. Herring, crimson-coloured; Lady Fitzwigram, a very dwarf-growing variety; Beauty of Eynsford, with perfectly-shaped flowers; E. Molyneux, a broad-petalled variety; Puritan, Etoile de Lyon, a conspicuous variety, with bold-looking flowers. The well-grown plants of Mrs. Irvine Clark were also good. Amongst the early-flowering varieties, Madame Desgranges, Mrs. Hawkins, and Mrs. Burrell, are the chief; Arthur Crepy is a plant that should find a place where accommodation is small, sixteen good-sized flowers being counted upon, a number of the plants growing in 5-inch pots. A large number of Pompon and single-flowered varieties are grown, and these were crowded with buds, promising a pretty show during the dull months. Plants of Miss Mary Anderson and Miss Rose, two of the best of this section, are grown in quantity, and the beauty of these single varieties seems to warrant them a large share of popularity. Decorative varieties are more appreciated in Edinburgh than very large blooms, and such varieties as Margot Elise, Roi de Précoce, largely grown, are not disbudded.

At Ravelston House, Blackhall,

a fine old garden, large numbers of Chrysanthemums are grown, and Mr. D. Jardine, the gardener, is a successful exhibitor of cut blooms and plants. The plants consist of the leading new varieties, all of which are very healthy-looking and vigorous, and although the expanded flowers were few in number, the great number of the buds were on the point of expanding, promising in a short time a remarkable show. The foliage of the plants is stout and leathery, and the wood hard, and well-ripened. The following are amongst those noted:—Charles Blick, a new Japanese variety of a golden yellow colour; Mr. H. F. Tiarks, a flower of great depth, having erect reddish florets; Silver Cloud, a vigorous grower, the flowers white shaded with salmon colour; and Silver King, a Japanese variety of very large size. The half-expanded flowers of Mrs. Nisbet, were of a lovely colour, the depth of purple amaranth being scarcely equalled by any other variety. Golden Wedding, a variety which gives some growers much trouble, was finishing its growth in 7-inch pots, the buds being strong and plump. The flowers of Lord Brooke will be very large. The hairy petaled varieties are well done, and at the time were commencing to unfold their florets. Louis Bœhmer, one of the first introduced of this section, is looking remarkably promising, as are also W. A. Manda and White Plume. The varieties, W. Seward, a dark crimson variety, is also good; W. K. Woodcock, J. Shrimpton, J. S. Dibdin, Yellow Avalanche, Florence Davis, Dr. Ward, Beauty of Exmouth, and Marie Hoste were amongst those noted. Many other varieties were in fine health. The trained specimens were well set with buds, which when in full flower should present a good exhibition appearance.

A good batch of seedling plants raised by Mr. Jardine during the spring, which possess good habit and distinct-looking foliage were showing flower. The development of these is being watched with much interest by this enthusiastic grower. *H.*

HOME CORRESPONDENCE.

PRODIGIOUS!—Slips of the pen are, of course, excusable in fiction, because, with sturdy adherence to truth, it would no longer be fiction. Still, when novelists, let them be ever so famous or talented,

profess to import facts into their stories, it is essential that the facts should be such, and not imaginary. That distinguished novelist, Mr. R. D. Blackmore, is so enthusiastic a pomologist that his fruit fancies constantly crop up in his books, and now and then readers find combined with a love story or scene some diversion into the realms of Pomona, rather than into the kingdom of Venus. In that interesting New Forest story of *Cradock Nowell* we are introduced to a follower of Galen, Dr. Rufus Hutton. He might almost be taken for a well-known resident of Teddington. The Doctor is a great gardener. But the writer grows in surprises when the Doctor invites a visitor to see his fruit garden. "Nowhere else in this part of the world can you see a piece of ground cropped in the manner of that, in 1873, so that *Cradock Nowell* was produced when the novelist's pomological enthusiasm was not tempered by that greater experience he has to-day. Certainly, so far as relates to Dr. Rufus Hutton's fruit garden, not revision but excision is needed. Glowing as is the description of the orchard-house which succeeds (we are not so enthusiastic about orchard-houses now), there is something painful in the reflections caused by certain economic references, "What a lot you must pay for wages," remarks a visitor to the Doctor. "Thirteen shillings a week in summer and seven shillings a week in winter!" That is how a prosperous novelist appraises a fruit-gardener's wages. "Mr.," says the visitor to the Doctor, "you must be either a conjuror or the devil!" *Reader.*

Fig. 69.—Branch of the Seckle Pear: grown in Messrs. Jas. Veitch and Son's Nursery, at Slough. (See p. 367, Sept. 29)

I believe!"—a declaration probably few will be disposed to question. "A plot of land four square, exactly half an acre, containing 2400 trees! There was no tree more than 5 feet high; the average height was 4 feet 6. They were planted just 4 ft. apart, and 2 feet back from the pathway. There was every kind of fruit tree there that can be made by British gardeners to ripen fruit in Britain without artificial heat. Pears especially, and Plums, Cherries, Apples, Walnuts, Figs, and Medlars, Quinces, Filberts, even Peaches, Nectarines, and Apricots, though only one row of these trees (I should think so, good heavens! what a medley); there was scarcely one of these miniature trees that had not done its duty that year, or now was bent on doing it." After reading this, especially about the 2400 trees at 4 feet apart, on half an acre of ground, and about the Figs, Walnuts, Peaches, Filberts, &c., as miniature trees, in this quarter, I turned to the front of the book, and found a preface by the author to a revised edition written

MICHAELMAS DAISIES.—I am sending you some varieties of Asters for your inspection, some being of recent introduction. They are greatly prized by my employer, being excellent for cutting purposes, lasting quite a fortnight in good condition if the water be changed occasionally. Asters flowering at a season when other flowers are getting scarce out of doors, and a few degrees of frost not hurting them, should find a place in every garden of any size. They are of easy culture, requiring plenty of water and diluted liquid manure when growing, and a soil porous rather than adhesive, which is the case in these gardens. Another point which always should have attention, is, not to tie up the plants like faggots as one often sees it done, but merely secure the main stems loosely to the stakes so as to admit light to the middle of the clumps. There are several in our collection which have still to flower, and many good varieties are past their best. *S. Kerry, The Priory Gardens, Witham.* [Our correspondent sends us a large selection, comprising several of the best, but too numerous to comment on. It will be remembered that for two or three years the Royal Horticultural Society got together at Chiswick a very fine and complete collection, which were duly studied by a committee appointed for the purpose, their names determined, and their merits adjudged. A report was published in the society's *Journal*, 1892, and a selection of the best kept for reference at the Chiswick trial ground. Ed.]

EALING GARDENERS' ASSOCIATION.—At this useful weekly gathering of gardeners and amateurs, it is the custom to reserve a night for discussion of questions which have been accumulating. At a recent meeting the chairman, S. A. Sewell, Esq., gave notice of what is certainly an original, and may be a good idea, this practically resolving itself into "hiring-out" greenhouses or similar structures by horticultural builders to those unable to effect the purchase of them at once. It seems a commendable notion, one that may possibly have in it great potentialities for good. Many a small amateur—and those of a similar type in poor circumstances, but ardent in their love and zeal for the gentle art—might be induced to hire a house on easy terms (as we read in the case of pianos!), and it is quite possible that they would get a better class of house for the trifling extra outlay than are the majority of so-called cheap (but in the end truly dear) houses, of which we see so many about now. Some of our horticultural builders who are feeling the pressure of bad times might do worse than encourage the "hiring-out" of greenhouses, &c., if ever it should come to pass. They would certainly be good advertisements, as the acquisition of such invaluable aids to more extended cultural flights would certainly soon become known amongst the enthusiastic hirers' circle of garden-loving acquaintances. *J. B.*

VEITCH'S CLIMBING FRENCH BEAN IN SCOTLAND.—I had some seeds of Veitch's climbing French Bean sent me this season for trial. They were sown by the side of some lines of the ordinary Scarlet Runners; but owing probably to the climate of this side the border being quite different to that of Surrey, or the coolness of the summer, the new Bean was not a success; indeed, it was quite a failure as regarded returns, although it grew as tall as the runners, and flowered pretty freely. Two small dishes of pods only were gathered, although Osborne's Forcing, Newington Wonder, and the Scarlet Runner have produced Beans in abundance. *John Page, Monteviot.*

MULBERRIES FAILING TO RIPEN.—In reading your correspondent's (Thos. Christy) remarks in your last issue regarding the failure of the Mulberry tree to ripen its fruits this year I was surprised, as there is on the lawn here one that has ripened a very heavy crop of large, well-formed fruit, the first ripe fruit being gathered on August 28, and the last to-day (October 16), a sample of which I enclose, with other fruit to be named. I may state that the soil is of a very cold nature; the tree named is also enclosed round by trees of the Siberian Crab and others. *J. R. Wilson, Haselbeck Hall, Northampton.* [The fruits sent by our correspondent were large but unripe, as they would be at this date. Ed.]

—— In the park at Gosfield Hall in Essex, there exists a large clump of Mulberry trees, which have ripened their fruit to perfection this year, and the fruit was fine and large. They are planted on a mound through which the rabbits have made many runs, which, no doubt, makes the soil very dry; the situation is exposed on all sides, and the soil a clayey loam. *J. F. M.*

MILDEW ON CHRYSANTHEMUMS.—Calling some little time since at a place where a collection of 500 to 600 specimen plants is well cultivated, I found the men busy in giving the plants a thorough dressing of some preventative against mildew [? aphis], which consisted of a solution of cyanide of potassium, in the proportion of a lump of the size of a Walnut to about 3 gallons of water was being used, the plants being laid on their sides and well syringed with the solution, and I was assured it was an excellent and cheap remedy. *Hortus.* [And also a very dangerous one—the cyanide being extremely poisonous. Ed.]

OLD VARIETIES OF THE SWEET BRIAR.—Now that Sweet Briars are coming to the front, it would be interesting to know if any of the old sorts are now in cultivation, and if so, I should be glad to hear from any of your numerous correspondents

who may have any of them. In a list given by T. Rivers, jun., of Sawbridgeworth, of some hundreds of Roses, and published in the *Florists' Register* in 1835, six sorts are mentioned, viz., Yellow Sweet Briar, small, double, straw-coloured; Superb, bright rose-coloured; Monstrous, pale blush, double; Celestial, very pale blush, double; Cluster, blue blush, double; Scarlet, bright red, double; all described as compact and double. *J. Pope, The Ericas, Middleton Hall Road, Northfield.*

AZARA MICROPHYLLA.—In the last issue of the *Journal of the Royal Horticultural Society* (August, 1894), Mr. Nicholson enquires how the above shrub has fared at Belvoir since 1890 (p. 58). In reply, I am pleased to say it is thriving well, the largest specimen being about 20 feet high and 16 feet in diameter. This one, as well as several more, have no protection during the winter except what is afforded by their position. They stand in a curve on the side of a hill which is open only to the south, and is well sheltered, but I would not advise the risking of this species in a cold situation unless protected in the winter, as it proved tender at Ketton Hall, although planted in a warm border and sheltered by other shrubs. Very probably it may not be tender anywhere within 100 miles N. of London if planted against a south wall, the main shoots only being secured to the wall, thus affording scope for its graceful pendent shoots. The agreeable aroma of its small yellow flowers is an additional charm, and when the plant is in a vigorous condition its shoots are useful for mixing with cut flowers in vases during the winter, when other light graceful foliage is not too plentiful. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

FASCIATED HOLLY BRANCH.—Amongst the most remarkable of the examples of plant fasciation which have come under my notice, considering the special nature of tree, was a specimen exhibited at the recent meeting of the Birmingham Gardeners' Mutual Improvement Association by Mr. J. B. Grove, nurseryman at Erdington, in the shape of an exceedingly vigorous current year's shoot of a comparatively young tree of the common Holly. It was about 30 inches long, and entirely clothed with rather small foliage, more or less spined. The fasciation was chiefly evident towards the end of the shoot, and about 2 inches in width at the widest part. Mr. Grove also exhibited one or two other similar abnormal growths, notably of annual flowers. *W. G.*

AGARICUS ARVENSIS.—In your correspondent's (Mr. E. J. Lowe, Chepstow) interesting remarks anent the production of the "Fairy-ring" Agaric in his park, he alludes to its having been unknown to the natives, a matter of some wonder, considering the number of years that these rings must have existed, producing Mushrooms in greater or lesser quantity, according to the nature of the summer. Regarding its flavour, this is decidedly stronger than that of the cultivated Mushroom, Agaricus campestris, and the flesh coarser, requiring, therefore, careful cooking. The bulk of those exposed for sale in the markets are used in the making of ketchup. *Fairy-ring.*

GRAPES AT THE CRYSTAL PALACE FRUIT SHOW.—Not only was the collection of twelve bunches of Grapes which secured for Mr. Alexander Kirk the 1st prize at the late fruit show superior to any other in the size of the berries and in some other respects, but it served as a capital object-lesson in Grape-thinning. When we consider the large size of the berries in this collection, it was evident that more than ordinary consideration had been bestowed upon the kind of thinning that each variety required, just sufficient to prevent crowding, and no more. There was thus no undue looseness in some, and crowding, with the usual accompaniment of mis-shapen berries, in others. Mr. Kirk himself thins his Grapes, as he said to the writer of this note at the show. *E. M.*

HABENARIA SUSANNÆ.—In the last issue to hand of the *Gardeners' Chronicle* (September 8) you figure, on p. 279, a white Habenaria, illustrated as Susannæ. It will perhaps be of interest to readers to know that I have collected here in Mussoorie, on the southern slopes of the Himalayas, large numbers of a grand white Habenaria, which I feel certain is the same species for which Messrs. Sander & Co. have obtained a Certificate. The variety here, at an altitude of something between 6000 and 7000 feet, grows perfectly wild in the jungle. The beautiful Hedychium coccineum is also a native of these hills; on the khuds (hill-sides) I have collected hundreds of grand tubers this year. *W. W. Johnstone, Himalaya Seed Stores, Mussoorie, N.W.P.* [Habenaria Susannæ is stated to occur in the tropical Himalayas from Garwhal eastwards. Ed.]

HARDINESS OF NICOTIANA AFFINIS AND OTHER PLANTS.—Not only does this plant come up every year, presumably from self-sown seed, on a bit of ground close to a greenhouse door, but it frequently appears in the herbaceous border. In the same manner this season, Ageratum mexicanum, Heliotrope, and Dahlia, have germinated from seeds of last year—a rather rare occurrence in this country. Self-sown Stocks and Asters I have frequently met with in other years. Some Melon seed was thrown on to a piece of ground in the winter, that was being dug, and in the spring it all came up, after having been buried for some months. *W. A. Cook, Compton Bassett.*

PEACHES OUT-OF-DOORS.—In spite of a cool summer we had the best out-of-doors crops of Peaches and Nectarines that I ever remember. The season began on June 17 with Waterloo, and fruits were gathered all through the season from Dymond, Grosse Mignonne, Sea Eagle, Goshawk, &c., so that the season has extended over four months. Sea Eagle was the latest, and the season being cold, temporary lights to assist the ripening of the fruit and as a safeguard against frost. The Peach and Nectarine trees receive the same kind of attention as those under glass, and they are in consequence clean and healthy, and to this I attribute in great measure my success. *W. A. Cook, Compton Bassett.*

FRUIT PACKING.—This subject is at present occupying the thoughts of various writers in the horticultural press, and I think it a suitable time to call attention to the circumstance that we in Scotland are supplied with Apples from America and the Continent of inferior quality to the best English Apples, yet we cannot get the latter, and I have repeatedly asked one of our largest fruit importers why he does not sell English Apples. The reply is always the same. "Teach your English friends to grade and pack their Apples as the foreigners do, and we will sell tens of thousands of barrels of them weekly, but at present they never come on our market in a condition that we can handle them." For my own part, I would as soon see Apples packed in boxes as barrels, for the barrels are often rolled down planks from the ships, and unless the fruit is very firmly packed it suffers, but in this respect the barrel system, as practised by the Americans, leaves little to be desired. Only certain leading Apples should be grown, and they should be carefully graded, and be as good throughout as on the surface, so as to gain the confidence of buyers, as the American Baldwins and their other Apples do, certain brands being taken without opening all the barrels. In this way my friend sometimes passes 10,000 barrels through his hands in a day at the ship's side, in Glasgow or Leith. I am certain a great trade in the best English Apples could be done in Scotland if it were done on method. *Wm. Thomson.*

STRAWBERRY SIR JOSEPH PAXTON.—I was surprised to find Mr. Bunyard omitting this fine old Strawberry from the list read by him at the Crystal Palace Conference. It must, I think, have been an oversight. Mr. Bunyard said during the discussion, that the flavour of the fruit was not good enough for the variety to be retained; yet I note he includes Laxton's Noble in the list of auxiliary varieties. Surely the latter cannot be compared with Sir J. Paxton in point of flavour; and it is the first time I have heard Laxton's Noble spoken of as being of good flavour. If those persons who condemn (or omit) Sir Joseph Paxton from even a list of select varieties could but see the hundreds of acres of this variety which enable hard-working families to exist in my neighbourhood (South Hants), I think they would come to the conclusion that a serious mistake was made in omitting the variety. I wonder what other Strawberry can compare with it in firmness of texture, which renders it a good traveller, and thus a distinct gain over most other varieties. Dr. Hogg, in *The Fruit Manual*, says of this Strawberry:—"A first-rate early fruit. The plant is hardy, very fertile, and forces well. This is one of the largest, and is probably the handsomest Strawberry in cultivation, and highly flavoured." Not a bad recommendation. *E. M.*

PLANTING-OUT FORCED STRAWBERRIES.—Mr. McLeod's note (p. 444) on Mr. Hudson's practice of cultivating forced Strawberries is not new, nor is it so generally adopted as it should be. Ten years ago I grew forced plants of Vicomtesse Héricart du Thury in pots for supplying fruit during the autumn. These were grown in the open air, with no other attention than watering the plants and removing the flower-scapes until the season had advanced to the period when they must be allowed to remain. Though requiring rather more attention in pots, there is the advantage that, if the weather should prove unfavourable, the fruit can be finished by placing the plants in a cool house or light pit. As also showing what may be done, I planted out forced plants of Vicomtesse H. du Thury at the end of last July, and a few days ago I gathered fruits from them, and shall do so again, while I have removed a great number of flower-trusses. I am of opinion that Sir J. Paxton would be amenable to such treatment, judging from some plants of this variety growing alongside of the Vicomtesse. *J. H. Slade.*

Continental Novelties.

STREPTOCARPUS LIECHTENSTEINENSIS.

A flower of this new cross—Wendlandi × Watsoni was shown by Mr. Lauche from the Eisgrub Gardens, Moravia, at the September meeting of the Vienna Horticultural Society. The plant had two leaves, one ovate elliptical, toothed at the margin, broadly-channeled, and somewhat bent downwards, thirty cm. long, and eighteen cm. broad; above of a green-coloured, slightly shining, rough-velvety surface, with a network of furrowed veins, beneath more or less suffused with purplish-red, and strongly furnished with projecting whitish, hairy nerves. The other leaf is erect and much smaller. Flower-stalks three to four in the axil of the larger leaf, and one to two in that of the smaller; purplish-green, hairy, about forty cm. high, carrying in the upper third of the stalk sixteen or more flowers. The pedicels are shorter than the flowers, which measure 55 millimètres; colour, lilac blue, the lateral segment as it approaches the throat furnished with three more intensely-coloured broadish stripes of purple, middle segment blue with three white stripes that widen and coalesce towards the throat. The plant flowers the first year from seed. *Garten Zeitung for October*, 1894.

Societies.

ROYAL HORTICULTURAL.

October 23.—The usual fortnightly meeting of this Society was held in the Drill Hall, James Street, Westminster, on Tuesday last. Fruit was again largely exhibited by the trade, and several competitive classes had been arranged for amateurs. Vegetables were also good. There were more Chrysanthemums than at the previous meeting, and Orchids were shown in something like the usual quantity.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. O. Thomas, H. Herbst, J. Laing, R. Dean, H. B. May, C. T. Druery, Geo. Stevens, P. Barr, C. F. Bause, C. Jeffries, W. Bain, Geo. Nicholson, Geo. Gordon, T. Godfrey, C. E. Shea, H. J. Jones, E. Beckett, C. E. Pearson, J. D. Pawle, Geo. Paul, and J. Fraser.

Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, Chelsea, obtained an Award of Merit for Begonia margaritacea, an ornamental-leaved variety of much merit. A nice collection of flowers of Javanico-Jasminiflorum hybrid of Rhododendron came from the same firm.

Some ornamental Gourds were shown by the Director of the Royal Gardens, Kew. There were two fruits of the Chinese wax Gourds (Benincasa cerifera), a native of tropical Africa, India, and China. The fruits are two feet long, cylindrical, and covered thickly with silvery crust. Three fruits of Momordica mixta, a native of the East Indies, attracted much attention from their rich coral-colour. They are about the size and shape of Ostrich eggs, and are covered with prickly excrescences as thickly as a hedgehog.

Sir Trevor Lawrence obtained a First-class Certificate for the pretty little Saintpaulia ioantha,

several plants of which were exhibited in flower. Some capital sprays of Salvia Pitcheri and L. splendens grandiflora were also shown; and some plants in flower of Begonia Couronne Lorraine, one of the rose-coloured winter-flowering Begonias.

Messrs. B. S. Williams & Son, Upper Holloway, had a group of Cannas, including Francisque Morel, a dark crimson; and L. E. Bailey, a beautifully-spotted flower on a yellow ground—a variety now very well known, and others.

Messrs. T. Cripps & Son, Tunbridge Wells, showed plants of Hypericum Moserianum tricolor in a basket, a tricoloured variety; and some sprays of Coprosma lucida in berry was sent by Mr. Moore from the Royal Botanic Garden, Glasnevin.

A grand group of Dræcanas was exhibited by Hy. Tate, Esq., Park Hill, Streatham Common, S.W. (gr., Mr. Wm. Howe). The plants were exceedingly well-grown, and included D. Baptisti, Robinsoniana, Goldieana, Lindeni, and many other coloured varieties (Silver Flora Medal).

Chrysanthemums:—We are now in the thick of the Chrysanthemum season, and that new varieties should put in appearance somewhat freely is not to be wondered at. Some very fine new Japanese were staged on this occasion. Foremost was a stand from Mr. H. J. Jones, Ryecroft Nursery, Lewisham, who had, perhaps, the greatest novelty of the year, a singularly distinct variety named Hairy Wonder. The colour is buff, with an apricot centre, the florets bristling with hairy appendages in a very singular manner. It was unanimously voted an Award of Merit—it is of good size and full substance. Mr. Jones had also the following promising varieties: Madame C. Capelard, blush, with pale pink centre incurved; Alice M. Lowe, a large broad-petalled pale flower; M. G. Montigny, pale ground striped with rosy-pink, broad florets; Miss Ethel Addison, rosy-magenta or amaranth, with silvery reverse; M. Auguste Lacvivier, buff, ground suffused with red, and having a golden reverse; a finely-incurved variety; Madame Ernest Frère, bright pink in the young flowers, becoming paler with age; and W. G. Newitt, white, very broad-petalled, incurved in its early stages, but becoming reflexed with age. Soon after the Floral Committee had completed its work, Mr. Jones received from Mr. Jas. Carruthers, Corstorphine, Midlothian, unfortunately too late to place before the committee, three blooms of his fine new Japanese Duchess of York, pale yellow in colour, with long, drooping florets, which would undoubtedly have gained an Award of Merit, all the foregoing being Japanese varieties.

Messrs. J. R. Pearson & Sons, Chilwell Nurseries, Notts, had Sarah Hill, an incurved Japanese, of a deep yellow-colour, large, full, and broad in the petal, which the committee thought to be too much like Coronet, but which Mr. C. E. Pearson said was quite distinct; and also M. G. Montigny, deeper coloured than the flowers in Mr. Jones' stand.

Messrs. H. Cannell & Sons, nurserymen, Swanley, had six fine blooms of M. Auguste de Lacvivier, described above (Award of Merit); L'Isère, white, with pale lemon centre, style of Boule d'Or; S. de Tambon, crimson, with golden buff reverse, in the way of E. Molyneux; Madame E. Rey, delicate rose, deepening to magenta, creamy reverse, broad petalled; Feu Follet, deep gold, suffused with reddish-salmon; and International, cream, with golden centre, and drooping florets.

From Mr. W. Wells, Earlswood Nurseries, Red Hill, came Golden Beauty, deep apricot-yellow, with fine drooping florets, flowers from the terminal buds being deeper in colour; also Duke of York, Favourite, Albani, bright pinkish lilac, the petals much notched at the tips, sweet-scented; President Armand, of the E. Molyneux type, and Louise, a very fine incurved Japanese, bluish, with very broad solid florets; Vice-President Calvat, crimson, with golden buff reverse; M. B. Spaulding, in the way of Princess May, having large drooping petals, pale yellow, with greenish centre; and Ethel Amsden, with whitish-green flowers, distinct, and very free-flowering.

Messrs. J. Veitch & Sons, Exotic Nurseries, Chelsea, set up a very fine group of plants of Japanese varieties, including Louise, very fine (Award of Merit), Col. W. B. Smith, Viviand Morel, John Shrimpton, Charles Davis, G. C. Schwabe, Mdlle. Marie Hoste, W. Tricker, Bouquet de Dame, L'Automne, Mdlle. Lacroix, and others (Silver Flora Medal).

Mr. W. J. Godfrey, nurseryman, Exmouth, brought a collection of very fine and promising new varieties, such as Florence Boyd, delicate peach; Mrs. E. G. Hill, blush, very fine; Miss Ethel Addison, rosy purple, with silvery reverse, large, broad petals; Van Den Heede, reddish-chocolate, with creamy reverse; Comtesse de Galbert, delicate creamy blush, a fine incurved Japanese; President Borel, bright pinkish rose, with creamy silver reverse; Madame Ernest Frère, deep pink, very pleasing; Mrs. Forbes, white; Souvenir de Madame Bouillier, deep crimson, with silvery reverse; Mrs. W. J. Godfrey, white, large, and broad petalled; Countess of Drogheda, gold, with reddish apricot centre; Wilfrid H. Godfrey, a large deep yellow variety; and Mons. Ch. Molin, buff, deepening to apricot, a very fine, distinct, and striking variety, unanimously voted an Award of Merit (Bronze Banksian Medal).

From Mr. G. Stevens, St. John's Nursery, Putney, came President Borel, a very fine Japanese, bright chestnut with silvery reverse, a fine full flower (Award of Merit).

Mr. W. J. Godfrey had blooms of his two fine winter-flowering Carnations, viz., Reginald Godfrey, salmon; and Miss May Godfrey, white, both of fine shape, and fragrant.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. James O'Brien (Sec.), Dr. M. T. Masters, H. M. Pollett, H. J. Chapman, E. Hill, C. Pilcher, T. B. Heywood, T. Statter, W. Cobb, and H. Williams.

Notwithstanding the cooler weather prevailing, some extensive and showy groups of Orchids, which included a number of rare and valuable species and varieties, were shown. The largest and brightest of these was the one staged by J. Gurney Fowler, Esq., Glebelands, Woodford, which contained a magnificent display of good varieties of Cattleya labiata, fine, well-grown, and profusely-flowered plants, and a number of the large form of Calanthe vestita, a fine variety of Cattleya Schilleriana, C. bicolor, varieties of C. Bowringiana, &c.; and the group was rightly awarded a Silver Flora Medal.

Next in extent amongst amateur exhibits was a fine group from R. I. Measures, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), in which the splendidly-flowered large plant of the rare white Oncidium ornithorhynchum album was in itself a fine object, which was awarded a First-class Certificate, together with a Cultural Commendation to the grower. The plant possessed seventeen flower-sprays. The other remarkable plants in Mr. Measures's collection were Cypripedium × Arthurianum, with nine flowers; C. × Mrs. Canham, with eleven; varieties of C. × Bellona, very pretty and quite dissimilar in colour and other points; C. purpuratum, C. insigne, the Cambridge Lodge var.; varieties of Cattleya labiata, C. bicolor, a fine Lælia tenebrosa, Pleurothallis plumosa, with many spikes; P. lepanthiformis (Botanical Certificate); Masdevallia attenuata (Botanical Certificate); M. Laucheana, white, with yellow tails (Botanical Certificate); and Odontoglossum Insleayii splendens. An award of a Silver Banksian Medal for the whole exhibit.

Messrs. W. L. Lewis & Co., Chase Side, Southgate, staged an effective group of good fresh-looking Orchids, including Vanda Sanderiana, many good forms of Cattleya labiata, C. Bowringiana, Miltonia spectabilis Moreliana, Masdevallia tovarensis, Dendrobiums, Cypripediums, &c.; and in the front part of the group a number of plants of the pretty Sophronitis cernua (Botanical Certificate). A Silver Banksian Medal.

Messrs. F. Sander & Co., nurserymen, St. Albans, had a fine display of the beautiful and graceful Dendrobium Phalænopsis Schroderianum, of various shades of white, rose, and purple; with these were the fine Odontoglossum Wattianum superbum (Award of Merit), a fine O. mulus, Lælio-Cattleya × exoniensis, Pescatorea Dayana, Cattleya O'Brieniana, C. labiata lilacina, varieties of Odontoglossum crispum, Cypripedium × Morganiæ Burfordiana, &c. (Silver Banksian Medal).

Messrs. Hugh Low & Co., Clapton, also made a good display, two very singular species appearing in their group among the showy Cattleya labiata, and fine display of Miltonia Roezlii. These species were Paphinia rugosa, a singular cream-coloured flower spotted with red, and having a curious spiny lip, and Dendrobium Cœlogyne, a creeping species of the class formerly called Bulbophyllum, and of which the largest and best-known is D. amplum (Bulbophyllum amplum). D. Cœlogyne has rather large, greenish flowers, profusely blotched with purple (Botanical Certificate). Messrs. Low were awarded a Silver Banksian Medal for the group.

Messrs. Jas. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, showed a pretty new hybrid in Lælio-Cattleya × Clonia (L.-C. × Turnerii ♂, C. Warscewiczii ♀). The small plant exhibited had a comparatively large flower, in form somewhat like C. Eldorado, but with a broad, circular, crimped front lobe to the lip, coloured rich purplish-crimson, like C. Warscewiczii. The median area of the lip at the mouth of the tube was chrome-yellow, its base reddish-purple, with fine veining of white. The tube on the outside was white at the base, and purple at the edges of the side-lobes (Award of Merit). Messrs. Veitch also showed the beautiful Cattleya × Wendlandii (Warscewiczii ♂, Bowringiana ♀), shown at the last meeting, and Lælio-Cattleya × Pallas (C. Dowiana ♂, L. crispa ♀).

A grand exhibit, made up of a few superb things, came from M. Jules Hye-Leysen, Coupure, Gand, the most remarkable of which was Miltonia × Bleuana rosea (M. Roezlii × M. vexillaria), which had flowers equal in size to those of the very largest form of M. vexillaria, and of a delicate blush-white tint, the inner halves of the petals having rose-purple colouring bearing evidence of M. Roezlii. The lip had fine red lines from the base, and the whole flower had remarkable beauty (First-class Certificate).

M. Jules Hye-Leysen also showed the richly-coloured Miltonia vexillaria Leopoldi, for which Baron Schroder received a First-class Certificate in 1889, and his stately Cypripedium × Albertianum which is the handsomest of the Leeana section.

F. Hardy, Esq., Tyntesfield, Ashton-on-Mersey (gr., Mr. Thos. Stafford), showed Cypripedium insigne Hardyanum, a beautiful clear yellow form with pure white upper half to the dorsal sepal, and resembling C. i. Sanderæ.

W. Cobb, Esq., Dalcote, Tunbridge Wells (gr., Mr. J. Howe), showed Odontoglossum aspersum fulvidum, a very handsome form with a distinct buff-coloured hue over the whole flower, which in size and marking resembled O. Humeanum. C. J. Lucas, Esq., Warnham Court, Horsham (gr., Mr. Duncan), showed Cattleya Alexandræ and Odontoglossum Wallisii.

R. Young, Esq., Fringilla, Sefton Park, Liverpool (gr., Mr. Poyntz), again showed his Cattleya labiata, Young's variety, which proves to be constant in the unusual breadth of the segments, and the purple feathering on each; also Cypripedium × Hermione (Spicerianum × barbatum Warnerii), a very neat and pretty hybrid.

T. Statter, Esq., Stand Hall, Whitefield, Manchester, (gr., Mr. R. Johnson), again showed the richly-coloured Cypripedium × memoria Moensii; also C. × amabile (Javanico-superbiens × Hookeræ); C. × Johnsoni (Lawrenceanum ×) Cattleya Warscewiczii, a light form said to flower in autumn; Cypripedium Charlesworthii conchiflorum, in which the concave form of the sepals appeared to be abnormal; and Cattleya aurea splendens.

Messrs. B. S. Williams & Son, Victoria and Paradise Nurseries, Upper Holloway, N., showed two plants of their fine Cypripedium Pitcherianum, Williams' var., one of which exhibited a curious reversal of the upper and lower sepals, a peculiarity which is said to be constant with this plant. Messrs. Williams also showed Dendrobium album, D. superbiens, D. Goldiei, and Lælia Perrinii nivea.

J. F. Alcock, Esq., Northchurch, Berkhamsted, sent Lycaste cruenta, Cypripedium Schlimii, Cattleya bicolor, Pleione Reichenbachiana, Brassia Lanceana, and Odontoglossum grande, with abnormal flowers.

R. S. Lutwyche, Esq., Beckenham, sent Miltonia Regnelli purpurea, a small supposed hybrid Miltonia, and a hybrid Cypripedium like an almost colourless C. × Ashburtonia.

A most remarkable exhibit was submitted to the committee by Mr. R. Hinds, gr. to M. Wells, Esq., Broomfield House, Sale; it consisted of a series of Orchid flowers dried by a new process worked out by Mr. Hinds, and which consisted in mounting them in picture form, the expanded flower being pressed flat and retaining the exact form and colour as when it was on the plant. The preparations were not only beautiful, but of great utility, and the committee voted Mr. Hinds a Silver Flora Medal.

Fruit Committee.

Present: P. Crowley, Esq., in the chair; and Messrs. T. F. Rivers, W. Wilks, G. Bunyard, S. T. Wright, T. J. Saltmarsh, J. Cheal, Alex. Dean, J. Wright, G. T. Miles, C. Ross, J. A. Laing, C. Herrin, G. Wythes, J. Hudson, W. Iggulden, W. Balderson, F. Q. Lane, Geo. Norman, J. H. Veitch, and Dr. R. Hogg.

Messrs. Jno. Laing & Son, Forest Hill Nurseries,

London, S.E., were responsible for a very excellent display of fruit, in about 250 dishes, including 200 dishes of Apples. Peasgood's Nonsuch, The Queen, Baumann's Red Reinette, Mère de Ménage, Sandringham, Cellini Pippin, highly coloured; Hollandbury's Scarlet Pearmain, Blenheim Orange, Gascoigne's Scarlet, New Hawthornden, Hoary Morning, were those noticed among a very large number of varieties. Pears were good, and included very pretty dishes of Beurré Diel, B. Superfin, B. Clairgeau, Seckle, and Doyenné du Comice. A Gold Medal was awarded this group. The fruit was backed by young trees of Bismarck, lifted from the ground, and shown in pots, to illustrate an exceptional crop of fruit.

Another large exhibit of fruit was made by Messrs. Jas. Veitch & Sons, Royal Exotic Nursery, Chelsea, including 150 dishes, chiefly Apples. Amongst these we noticed Peasgood's Nonsuch, Cox's Pomona, Tyler's Kernel, Mother Apple, Warner's King, Sandringham, Alexander, King of the Pippins, Worcester Pearmain, Washington, Calville Boisbunel, Mère de Ménage, and many others deserving of notice. Among Pears the Seckle was shown in very good quality, Flemish Beauty, Magnate, Beurré Superfin, the high-coloured Forelle, Marie Louise d'Uccle, Pitmaston Duchess, and the new Beurré Fonqueray were noticed (Silver-Gilt Knightian Medal).

From Mr. John Watkins, Pomona Farm, Hereford, came a collection of Pears in about forty dishes; Marie Louise d'Uccle, Doyenné Boussoch, Louise Bonne of Jersey, Beurré Baltet Père, and Beurré Diel, were noticed as of fine quality (Silver Banksian Medal).

Messrs. J. Cheal & Sons, Lowfield Nurseries, near Crawley, exhibited a collection of fruit, and were awarded a Silver-gilt Knightian Medal. The most noticeable of this fine exhibit were Cox's Pomona, Loddington, Frogmore Prolific, Bismarck, Peasgood's Nonsuch, and Duchess of Oldenburg Apples, King of the Pippins Apple; and a good number of Pears, including The Mikado, a Japanese Pear of more interest than use (Silver-gilt Knightian Medal).

C. Lee Campbell, Esq., Glewston Court, Ross, Herefordshire (gr., Mr. S. T. Wright), exhibited six bunches of Gros Colmar Grapes, alike excellent in berry and in colour (Silver Banksian Medal).

A collection of Potatos, in about eighty varieties, was shown by the Earl of Carnarvon, Highclere, near Newbury (gr., Mr. Pope). The quality of these tubers was good, and fair specimens of blue, white, and red kinds were staged (Silver Banksian Medal).

From the Rev. — Terrace, Woburn Park, Weybridge (gr, Mr. Basil), came a collection of vegetables, in which were very good Parsnips, Carrots, Drumhead Cabbage, and Red Cabbage, &c. (Bronze Banksian Medal).

A very fine lot of Celery obtained a Silver Knightian Medal for H. H. Gibbs, Esq., Aldenham Park, Elstree (gr., Mr. E. Beckett). The varieties were Veitch's Early Rose, Sutton's Solid White, Col. Clarke's, Sutton's A 1, Cutbush's Dwarf Crystal White, Laing's Mammoth Red, Standard Bearer, Carter's Solid Ivory White, Sutton's White Gem, and three others.

Messrs. Jas. Veitch & Sons, Chelsea, showed specimens of Veitch's Selected, Rosette Colewort, a compact neat looking variety. Colonel Archer Houblon, Welford Park, Newbury (gr., Mr. Chas. Ross), exhibited a seedling Apple named Lady Alice Eyre, a rather small little coloured fruit, and a seedling Pear named Popham.

An Award of Merit was granted to a seedling Melon named the Earl's Favourite, shown by Mr. H. W. Ward, gr. at Longford Castle, near Salisbury. This good-flavoured Melon for so advanced a season is the result of a cross between Hero of Lockinge and The Bouverie.

A small red Plum named Burdon's Eclipse was shown by Mr. Thos. Godfrey, Edmonds' Nursery, Hillingdon. It is described as the latest of the Orleans section, and ripening about the middle of November. An Award of Merit was given to a small red Plum named the Late Rivers, shown from the gardens of the Royal Horticultural Society at Chiswick.

From Mr. J. Watkins, Pomona Farm, near Hereford, came some high-coloured Apples labelled Pickering Seedling; and from the Marquis of Huntly, Orton Hall, Peterborough (gr., Mr. A. Harding), a dish of Pears, Orange Bergamot, and a dish of large high-coloured Apples, named Orton Favourite.

Mr. Robert Fenn, Sulhampstead, near Reading, exhibited a tuber each of thirty-three seedling Potatos raised by himself, and grown free from disease during the present year by the use of an anti-blight powder.

In a competitive class for six bunches of Grapes, there were two competitors, and the 1st prize was taken by Mr. Wm. Howe, Park Hill Gardens, Streatham Common, S.W. He had two bunches each of Gros Maroc, Muscat of Alexandria, and Black Alicante. Mr. T. Osman, Ottershaw Park Gardens, Chertsey, was 2nd.

A competitive class, arranged for seven dishes of Apples, including three of dessert and four of culinary varieties, grown in the open, was won by C. Lee Campbell, Esq., Glewston Court, Ross, Herefordshire (gr., Mr. S. T. Wright). His fruit was very fine, and consisted of Peasgood's Nonsuch, Ecklinville Seedling, Warner's King, Beurré Hardy, King of the Pippins, Ribston Pippin, and American Mother. The 2nd prize was taken by the Duke of Northumberland, Syon House, Brentford (gr., Mr. G. Wythes), who had also fruits of good quality.

The 1st prize for five dishes of dessert Pears was taken by Mr. Thos. Osman, Ottershaw Park Gardens, with splendid dishes of Pitmaston Duchess, Beurré Clairgeau, Marie Louise, Beurré Superfin, and another; Mr. Geo. Wythes was 2nd.

Mr. T. Spencer, Goodrich Court Gardens, Ross, was 1st in an open class for eight dishes of dessert Pears, grown in the open; he had excellent Durondeau, and Beurré Bachelier, Marie Louise d'Uccle, Beurré d'Amanlis, B. Superfin, B. Baltet, Duchesse d'Angoulême, and Benedictine. Mr. T. Osman, Ottershaw Park Gardens, was 2nd; he had good Beurré Bosc, Marie Louise, Duchesse d'Angoulême, and Durondeau. Mr. Geo. Wythes was 3rd.

Mr. G. Wythes, gardener to the Duke of Northumberland, Syon House, Brentford, showed a very fine collection of eighty kinds and varieties of vegetables, roots, bulbs, &c. It was an unusually large quantity for a private garden, and much very good produce was to be found in the collection. We may specify some well-blanched Cardoons, a number of varieties of Runner and French Beans, luckily preserved from the frost; Princess French Bean was one of these, with prominent seeds, but brittle and tender, the old Syon House variety, White Mammoth Runners; Celeriac, which showed by their smallness the lack of sun this season; two varieties of Kohl Rabi, a nice vegetable, but not appreciated as it deserves to be in this country; numbers of Cabbages in variety, including the now rarely-grown Winnigstadt, an excellent hardy variety; Onions, Veitch's selected Globe, of nice oval shape; and Veitch's Main Crop; a curiosity in Red Globe Turnips; Veitch's Self-protecting Broccoli, nice, small, and compact, and pure white; Autumn Giant Cauliflowers were also good produce. Potato The Brinksworth is a solid, weighty tuber, fit for general consumption. The Lyons Prolific Kidney is an appetising-looking tuber. Matchless Carrots and Exhibition Shallots left nothing to be desired; Brussels Sprouts in this, as in most collections nowadays, were too large and too absorbent of water when cooked, which cannot be got rid of without mashing the sprouts by over-much squeezing. We do not know why the Drumhead Cabbage should find a place in any gentleman's garden however fine and large it may be. There were many more meritorious things, which cannot now be mentioned. A Gold Medal was awarded.

Six excellent examples of Gros Colmar Grapes, compact of bunch, large in berry, and perfect in colour, came from Mr. Wright, gr. to C. Lee Campbell, Esq., Glewston Court, Ross, Herefordshire (Silver Banksian Medal).

Sir Trevor Lawrence, Burford, Dorking (gr., Mr. Bain), sent some new white Jerusalem Artichokes, Veitch's Red Globe Turnips, several French varieties of Chou Navet, and other French vegetables.

Lecture by Professor Henslow.

In the afternoon a lecture was given by the Rev. Professor Henslow, on "The Origin of Common Vegetables, and their value as Food." For some remarks upon which see p. 504.

KENT COUNTY SHOW OF HARDY FRUITS.

October 23, 24.—This annual exhibition was held in the Corn Exchange, Maidstone, and if there were fewer exhibits than on previous occasions, the show was on the whole a good one, exceeding the expectations of fruit-growers in the district. From F. S. W. Cornwallis, M.P., Linton Park (gr., Mr. Mackenzie), came a handsome group of plants. H. L. C. Brassey, Esq., Preston Hall (gr., Mr. Jarman), sent over fifty dishes of fruit of good quality and finish, together with a large group of Palms. About sixty dishes of Pears and Apples were sent from R. Leigh, Esq., Barham Court (gr., Mr. Woodward). A very meritorious collection of plants came from Messrs. Frost, Ling Nurseries, Maidstone; and there were also a capital lot of Pears from Lady Howard de Walden, The Mote (gr, Mr. Fielder). Mr. A. J. Thomas, Rodmersham, was 1st for one sieve of Cox's Orange Pippin Apple; and Mr. Huller, Hunton, with fine King of the Pippins, was 1st in a class for any other dessert kind.

There were some very fine fruits shown in the class for one sieve of Kitchen Apples. Mr. Lockyer, Bearstead, was 1st, with Warner's King; and Mrs. Fremlin, Teston, was 2nd, showing the same variety.

Mr. Smith, Loddington, was 1st for four quarter-sieves of dessert Apples, showing handsome Ribstones, Ross Nonpareil, Mannington Pearmain, and King of the Pippins. Mr. Lockyer was 1st for two quarters.

Class 6.—Mr. A. T. Killick was 1st for four quarters of kitchen Apples; and Mr. Fremlin, Langley, 1st for two quarters.

Mr. Bleat, Wateringbury, was 1st for two quarters of Pears.

For a collection of farm-grown Apples in nine dishes, and Pears in three dishes, Mr. Thomas was well to the fore, his collection being heavy throughout; Mr. Smith was 2nd.

Four dishes of Apples and two of Pears, 1st, Mr. Killick. Mr. Woodward was an easy 1st for twenty-four dishes, showing in his usual style; Mr. Thomas was 2nd. For eighteen dishes of Apples and six dishes of Pears, Mr. Woodward was again 1st.

Trade Notice.

Mr T. W. Edmunds wishes us to make known to our readers that from November 17, 1894, he will take the Darenth Nursery and Seed Shop lately in the occupation of Mr. Arthur Jeffkins. Mr. Jeffkins' nursery stock and seeds having been absolutely cleared off by auction, the grounds will be entirely replanted by Mr. Edmunds.

Obituary.

Mr. Robert Petfield, for many years gardener at Diddington, Huntingdon, the residence of A. J. Thornhill, Esq., died, on the 22nd inst., at the age of sixty-nine years. Mr. Petfield had been in delicate health for some time past, and at intervals entirely confined to the house, his youngest son, who is with him at Diddington, taking charge of the gardens during his enforced absence. Born at Anlaby, Yorkshire, on February 19, 1826, he came to Diddington in September, 1854, when he was twenty-eight years of age, and had charge of the gardens till the time of his death. He was a keen florist, cultivating the Dahlia for exhibition purposes with great success, carrying off first prizes at the shows of the National Dahlia Society at the Crystal Palace, and also at such provincial exhibitions as Cambridge, Sandy, St. Neot's, Bedford, and Huntingdon, when the latter town used to hold three shows a year, though no exhibition is held there now. During the last eight years he took great interest in the cultivation of the Chrysanthemum, and was very successful as an exhibitor. In addition to being a member of the National Chrysanthemum Society, he was also connected with that at St. Neot's, and was largely instrumental in winning for that society the national trophy of the National Chrysanthemum Society in 1890, and again in 1892. In 1893, Mr. Petfield won outright the St. Neot's challenge cup, value ten guineas, and became its owner, and with flowers grown solely by himself, winning once more the trophy of the National Chrysanthemum Society for St. Neot's, his flowers being remarkably fine throughout, thus closing a successful career as an exhibitor with all the honours of war. But amid all this devotion to his favourite flowers, Diddington gardens and grounds were always maintained in a manner to call for high praise. He was buried in

Diddington churchyard on Wednesday, amid the regrets of many who knew him. He leaves a widow, three sons, and two daughters to mourn his loss.

MARY PARKER THOMSON.—We regret to record the death of Mrs. Mary Parker Thomson, wife of the well known horticulturist, Mr. David Thomson, which occurred at The Gardens, Drumlanrig, Thornhill, Dumfriesshire, on Thursday, October 25.

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

WATTLED HURDLES FOR WIND GUARDS.—Mr. Wm. Brockbank, Brockhurst, Didsbury, would be glad to be informed by some of our correspondents where he can obtain the above, so useful in winter as wind-breaks. It would pay, he says, for a maker to advertise them in our columns at the proper season.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature. Above (+) or below (−) the Mean for the week ending October 20.	Accumulated. Above 42°, for the Week.	Accumulated. Below 42°, for the Week.	Accumulated. The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S.

Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending October 20, is furnished from the Meteorological Office:—

"The *weather* was cold and somewhat unsettled generally, with rather frequent rain in the north and north-west. Some intervals of fine, clear weather were experienced, however, in nearly all districts. At the end of the period sharp thunderstorms occurred at some of the south-western stations.

"The *temperature* was below the mean, the deficit ranging from 2° in the 'Channel Islands,' to 5° in 'Scotland, W. and Ireland, S.' The highest of the maxima were recorded, as a rule, on the 14th, and ranged from 62° in 'England, S.W.,' 61° in the 'Channel Islands,' and 60° in 'Ireland, S.,' to 53° in 'Scotland, W.,' and to 52° in 'England, N.E.' The lowest of the minima, which were registered at about the middle or the latter part of the week, ranged from 19° in 'Scotland, E.,' 21° in 'Ireland, N.,' and 22° in 'Scotland, W.,' to 34° in 'England, E. and N.E.,' and to 39° in the 'Channel Islands.'

"The *rainfall* was greatly in excess of the mean in 'England, N.E.,' and slightly so in 'Scotland, E.' In all other districts, with the exception of 'England, E.,' where the fall just equalled the normal, there was a deficit. In 'Scotland, W.,' 'England, S.,' and the 'Midland Counties,' the fall was very slight.

"The *bright sunshine* was more prevalent than during the preceding week, and exceeded the mean in all the 'Grazing Districts,' as well as in 'Scotland, N. and E.' The percentage of the possible duration ranged from 44 in the 'Channel Islands,' and 40 in 'England, S.W.,' to 24 in the 'Midland Counties,' 21 in 'Scotland, E.,' and 20 in 'England, N.E.'"

MARKETS.

COVENT GARDEN, October 25.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. ED.]

POTATOS.

The market is being kept rather short of supplies by farmers who are now busy with other work on the land while favourable weather continues. Prices in consequence have made slight advances in most cases. Best kinds, good samples, 85*s.* to 100*s.*; ordinary samples and blacklands, 55*s.* to 70*s*, *J. B. Thomas.*

SEEDS.

LONDON: *October* 24.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market quiet. Winter Tares and Rye are in diminished request. New Mustard and Rape seed are cheaper than ever before known. Rye-grasses very dull. A few sales are reported of Alsyke; white is still very dear. Red Clover seed and Trefoil neglected. Bird seeds show no important change. Scarlet Runners have advanced. Peas and Haricots steady. Linseed easier.

FRUITS AND VEGETABLES.

BOROUGH AND SPITALFIELDS: *October* 23.—Quotations:—Cabbages, 1*s.* 6*d.* to 3*s.* 6*d.* per tally; Turnips, 1*s.* 6*d.* to 2*s.*; Carrots, 1*s.* to 2*s.*; Parsley, 9*d.* to 1*s.* per dozen bunches; Horseradish, 1*s.* to 1*s.* 6*d.* per bundle; Onions, foreign, 2*s.* to 2*s.* 6*d.* per bag; do., English, 3*s.* 6*d.* to 4*s.* 6*d.* per cwt.; Apples, 2*s.* to 6*s.* per bushel; Pears, 9*d.* to 3*s.* 6*d.* per half sieve.

STRATFORD: *October* 24.—This market has been well supplied with all kinds of produce during the past week, and, with a large attendance of buyers, a brisk trade was done at the undermentioned prices:—Cabbages, collards, 2*s.* to 2*s.* 6*d.* per tally; Savoys, 2*s.* to 4*s.* do.; Greens, 3*s.* to 4*s.* do.; Cauliflowers, 3*s.* to 4*s.* do.; Turnips, 1*s.* 9*d.* to 2*s.* 6*d.* per dozen bunches; Carrots, household, 30*s.* to 40*s.* per ton; do., cattle-feeding, 25*s.* to 32*s.* do.; Parsnips, 7*d.* to 9*d.* per score; Mangels, 10*s.* to 15*s.* per ton; Swedes, 14*s.* to 18*s.* do.; Onions, English, 3*s.* 6*d.* to 4*s.* per bag; do., Dutch, 2*s.* to 3*s.* per bag; Apples, English, 2*s.* 6*d.* to 4*s.* per bushel; do., American, 12*s.* to 14*s.* per barrel; Pears, 3*s.* to 3*s.* 6*d.* per sieve; Cucumbers, 1*s.* to 1*s.* 6*d.* per dozen; Tomatos, English, 4*s.* to 5*s.* per dozen lb.

FARRINGDON: *October* 25.—Quotations: Turnips, 1*s.* 3*d.* to 1*s.* 6*d.* per dozen; bunch Greens, 1*s.* to 1*s.* 3*d.* do.; Savoys, 2*s.* 6*d.* to 3*s.* per tally; Cabbages, 1*s.* 6*d.* to 2*s.* per doz.; Celery, 8*s.* to 9*s.* per doz. rolls; Carrots, 1*s.* 9*d.* to 2*s.* per bag; Lettuces, 5*d.* to 6*d.* per score; Apples, cooking, 3*s.* to 4*s.* per bushel; do., dessert, King Pippins, 2*s.* 6*d.* to 3*s.* per half-sieve; Sprouts, 1*s.* do.; Beetroots, 1*s.* 3*d.* per bushel; Parsnips, 3*s.* per cwt.; Horseradish, best, 1*s.* 3*d.* per bundle; Cucumbers, 1*s.* 6*d.* to 1*s.* 9*d.* per doz.; Walnuts, 24*s.* per sack; Grapes, 11*s.* per barrel; Plums, 2*s.* 6*d.* per half-sieve; Pears, 3*s.* 6*d.* per half-sieve; Tomatos, good English, 5*d.* per lb.

POTATOS.

BOROUGH AND SPITALFIELDS: *October* 23.—Quotations ranged from 45*s.* to 80*s.* per ton.

STRATFORD: *October* 23.—Quotations:—Magnums, Darkland, 50*s.* to 55*s.*; Light-land, do., 60*s.* to 75*s.* per ton.

FARRINGDON: *October* 25.—Quotations:—Sutton's Abundance, 80*s.* to 100*s.*; Bruces, 60*s.* to 70*s.*; Magnums, 60*s.* to 80*s.*; Imperators, 60*s.* to 70*s.*; Hebrons, 70*s.* to 90*s.*; Main Crop Kidneys, 70*s.* to 80*s.* per ton.

LONDON AVERAGES: *October* 24.—Snowdrops, 80*s.* to 95*s.*; Magnums, 50*s.* to 70*s.*; Hebrons, 60*s.* to 80*s.*; Main Crop, 80*s.* to 90*s.*; Black-lands, 50*s.* to 55*s.*; Kidneys, 60*s.* to 70*s.* per ton.

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending October 20, and for the corresponding period last year:—1894: Wheat, 17*s.* 6*d.*; Barley, 23*s.* 11*d.*; Oats, 13*s.* 6*d.* 1893: Wheat, 27*s.* 6*d.*; Barley, 29*s.* 6*d.*; Oats, 18*s.* 1*d.*

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 75*s.* to 132*s.*; do., inferior, 45*s.* to 120*s.*; hay, best, 60*s.* to 120*s.*; do., specially picked, 130*s.*; do, inferior 36*s.* to 60*s.*; Mixture, 90*s.* to 120*s.*; and Straw, 22*s.* to 38*s* per load.

SPRAYING CROPS.—Our American cousins are much more enthusiastic about the merits of spraying than we are. Our apathy is, however, gradually breaking down, and it may be expected that the Technical Education lectures and demonstrations will hasten that process. One thing to be specially inculcated is, that spraying is done not with a view to cure but as a preventative. It is no use putting a lock on the stable door when the horse has been stolen, unless it be to prevent a similar lot overtaking another horse. In a little book entitled *Spraying Crops*, to be had from Kegan Paul, Trench, Trübner, & Co., Paternoster House, Charing Cross Road, full details are given as to why, when, and how, spraying should be done. We commend it to all growers on a large scale. Of course, spraying needs to be done with great judgment, the operator always bearing in mind that he is dealing with poison. At the same time, if spraying is properly done at the right time, and in the right way, it is a very profitable operation, at least, so say our American friends, who look very sharply after the dollars. Provided the conditions already mentioned are duly observed, there can be no danger whatever of poisoning the consumer.

Answers to Correspondents

*** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

*** Plants, Fruits, etc., to be Named.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six varieties should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

Apple, Cox's Pomona: *G. B.* A very fine example of free setting.

Corrections. — Messrs. Colby, Hinkley & Co., of 10, Tudor Grove, Wells Street, Hackney, desire to say that they are the only makers in this country of the nests of boxes for soft fruit transportation, and not Messrs. C. H. Clover & Co., as stated in our report of the Crystal Palace Fruit Show, October 6, p. 412.—At p. 472, col. *b*, line 4, for *needlessly* read *endlessly*.

Fruit Culture in Devon and Cornwall: *W. D. W.* The valleys running south in Cornwall, and all parts of Devon except the Exmoor and Dartmoor districts. Avoid selecting land quite close to the coast, unless well sheltered from the south-west wind.

Land and Houses at Worthing: *E. J. S.*—In your houses grow Begonias Gloire de Sceaux, John Heal and Adonis; Cœlogyne cristata, Cypripedium insigne, best varieties; Odontoglossum crispum, Cymbidium eburneum, The "Pearl" Tuberose, Lily of the Valley, very early or very late Lilium longiflorum, and L. l. var. Harrisi, and L. Krätzeri. If a house should happen to be empty in the summer, grow early Sweet Peas, Eckford's fine strains, selecting a few pink, white, and dark varieties, not too many, growing them well in large pots, or planted out. The flowers fetch good prices if got into the market early. These Sweet Peas would make a good crop, as would Lilies, such as japonicum, lancifolium, and candidum, for your 2 acres of land; paying much better than Potatos.

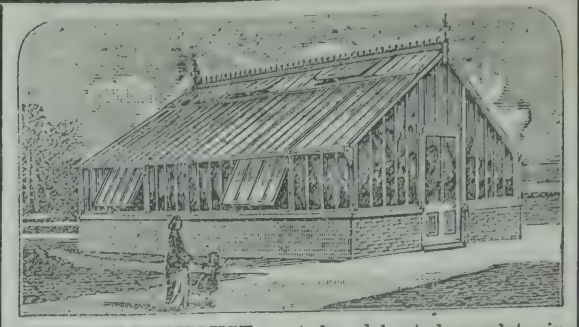
Names of Fruits: *S. A. Newman.* 1, Rosemary Russet; 2, King of the Pippins; 3, Dumelow's Seedling; 4, Duck's-bill; 5, Hollandbury; 7, Louise Bonne of Jersey.—*R. P.* 1, Beurré Bosc; 2, Marie Louise.—*S. & D.* 2, Seckle. The others so poor and miserable that they cannot be identified. —*A Constant Reader.* 1, Duchesse d'Angoulême; 2, Brown Beurré; 3, Beurré Diel; 4, Duchesse d'Angoulême; 5, Glou Morçeau; 6, Chaumontelle. —*C. Mainwaring.* 1 and 2, local seedlings; 3, Forge; 4, Duchesse d'Angoulême; 5, Beurré Diel.—*Heaton.* 1, Beurré Diel; 2, probably Marie Louise; 3, Bergamotte d'Esperen; 4, Beurré Bosc; 6, Duchesse d'Angoulême.—*B. G.* 1, Maréchal de la Cour; 2, not recognised; Apple decayed; 3, Josephine de Malines; 4, Marie Louise.—*A. Chapman.* 1, Triomphe de Jodoigne; 2, Old Crassane; 4, Fondante d'Automne?—*E. J.* 1, Josephine de Malines; 2 and 4, Glou Morçeau; 3, Gansel's Bergamot; 5, Glou Morçeau.—*Tong.* 1, Catshead; 2, Grange's Pearmain; 3, Tibbett's Pearmain; 4, Stone's; 5, not recognised.—*J. Howe.* 1, Thomsons; 2, Beurré Diel.—*H. Redder.* 1, Beurré Bosc; 3, Beurré Diel; 4, Van Mons Léon Leclerc.—*E. Chester.* 1, Glou Morçeau; 2, Beurré d'Aremberg; 3, Maréchal de la Cour.—*J. D. C.* King of the Pippins.—*W. W. T. H. C.* 10, Beurré Diel; 11, Josephine de Malines; 9, Glou Morçeau; 8, French Crab; 2, Brabant Bellefleur; 12, Greenup's Pippin.—*J. R. W.* 2, Gansel's Bergamot; 4, Beurré Diel; 5, Old Crassane; 6, Van Mons Léon Leclerc; seedling Apple of no value. — *G. Kent.* 1, Autumn Bergamot; 2, Williams' Bon Chrétien; 3, Easter Beurré; 4, Golden Noble; 5, Beauty of Kent.—*J. P.* Apple Grenadier.

Names of Plants: *J. C. Stagden.* 1, Ag. (Arm.) melleus; 2, Ag. (Clitocybe) inversus; 3, Ag. (Clito.) laccatus; 4, Clavaria cristata; 5, Clavaria fragilis; 6, Ag. (Psilo.) Fœnisecii; 7, Xylaria hypoxylon.—*D. & Co.* Helianthus diffusus? imperfect specimen. — *G. C.* 1, Viburnum Lantana; 2, V. opulus; 3, Spiræa opulifolia.— *C. W. L.* 1, Pyrus communis (wild form, or near to it); 2, Pyrus salicifolia; 3, Fraxinus excelsior var. nana, "dwarf bushy plant," a very curious variety of the common Ash, by no means common. — *T. F.* Pelargonium echinatum.—*J. C.* Shrivelled and packed in cotton wool, the worst of packing material. 1, Astrantia major; 2, Matricaria inodora, double var.; 3, Geranium sanguineum. — *Brier.* 1, Saponaria officinalis, double fl.; 2, Santolina incana; 3, Eupatorium cannabinum.—*B. B.* Both are Yews, one is probably the Irish Yew, but we cannot tell from a mere scrap. —*W. L. L.* Your plant is typical Lælia pumila. It is not usual for it to bear a three-flowered inflorescence.—*T. N. Poole.* Adhatoda cydoniæfolia, allied to Justicia.—*W. Thomson.* Malope trifida.—*Post-mark, Finchley.* A correspondent, who sends neither name nor address, encloses four leaves, which we believe to be—1, Sparmannia africana; 2, Abutilon; 3, Cyclamen; 4, Gloxinia. —*W. J. P.* 1, Azara microphylla; 2, A. Ceanothus (not in bloom); 3, Hippophae rhamnoides, Sea Buckthorn; 4, perhaps Spiræa Douglasi (not in bloom); 5, yes, we agree it is a very poor scrap, probably of Alstrœmeria Pelegrina; 6, not recognised.

Peach Trees and Crag from the Cliffs, &c.: *G. C. B.* We would not recommend the use of much of this material, there being much iron in it. Lime rubble, sand, a small quantity of finely-screened coal-ashes, or burnt soil (ballast) would be better. If you cannot obtain any of these, lift the trees and replant them, keeping the roots near the surface. This may have to be done every third year, till the soil has got somewhat exhausted of its richness. The vine-roots are probably at too great a depth in the 5-feet deep border, therefore out of the reach of sunheat; and unless the border was exceptionally well made, the soil at, or near the bottom, will have been rendered close and adhesive, and apt, therefore, to hold too much water. Replant them near the surface, and examine the state of the drainage, putting it in good order if found to be faulty, and making a new and much shallower border if the present one does not seem satisfactory. Now is the time to do this. The Vines having half-ripe Grapes on them are not likely to perfect the fruit, or should it get ripe before the leaf falls it will not keep.

Pears Worked on the Mountain Ash: *W. T.* As these are members of the same natural order, they would form durable unions one on the other, more so than Pear on Apple, which usually last for a few years only. We do not remember to have remarked a Pear growing on the Mountain Ash. In Bailey's *The Nursery Book* (Rural Publishing Co., New York), it is stated that the latter is used for a stock in very sandy land, but its use appears to be of little consequence. The growth of a scion would doubtless be more rapid on this than on stocks of Thorn or Medlar.

Rosa sps., sent as R. laxa: *J. W. W.* The plant sent is certainly not Rosa laxa, but a form of R. canina. *G. N.*



The Papers Read at the Late Great Fruit Show at the Crystal Palace: *C. B.* Those mentioned in your note will be found in our issue for October 6, in a but little abridged form, and they will be published in full in the *Journal* of the Society.

Trees and Shrubs for the Grand Canaries: *R. M.* We may say generally the native lowland plants of New Zealand, Japan, the Cape, South Australia, Southern China, Peru, Chili, and including much that we understand by cool and warm greenhouse plants. Tea-scented and other Roses would likewise grow and bloom well.

THE IMPROVED GARDEN GULLY

(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are :—

8-in., 2*s.*; 10-in., 3*s.*; 12-in., 6*s.* 6*d.*

(*The larger sizes are very strong for Carriage Drives.*)

Full Particulars and Testimonials on application.

VINCE & VINE,

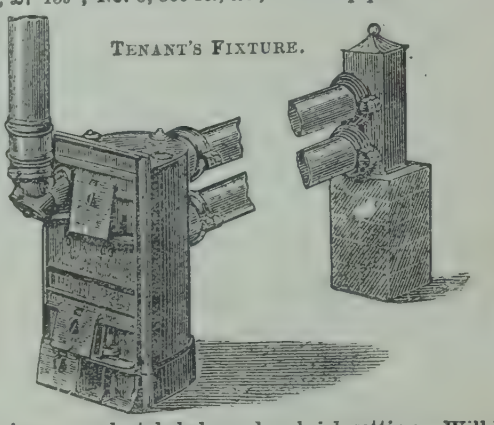
AMATEUR FORCING HOUSE.



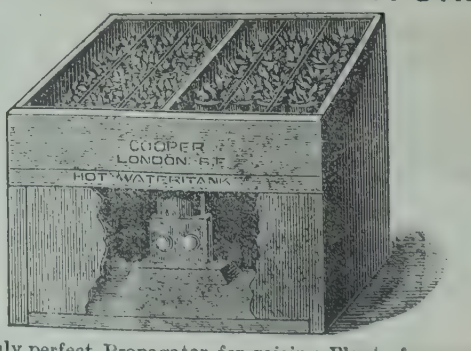
The utility of this house for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance, it being a structure constantly in request, but almost hitherto unknown. See LIST, p. 22. Send for LIST, post-free.

"INVINCIBLE" HOT-WATER APPARATUS.

Most Efficient and Cheapest in Existence.

Made in six sizes: No. 1, to drive 75 ft., £1 15*s.*; No. 2, 100 ft., £3; No. 3, 200 ft., £4 10*s.*; No. 4, 275 ft., £7; No. 5, 375 ft., £7 15*s*; No. 6, 500 ft., £9; of 4-in. pipes.

Requires no sunk stokehole, and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.

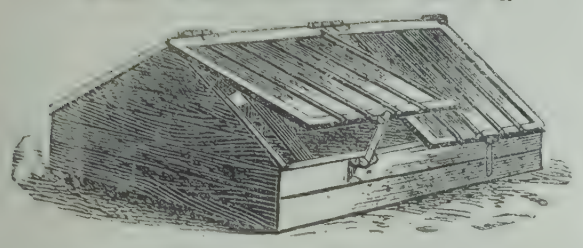


Cost of complete apparatus for Greenhouse with 4-in. pipes, flow and return along one side, cut and fitted; so that if the internal measurement of the Greenhouse is given, the apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all. Securely and carefully packed on rail at the following respective prices:—7 ft. by 5 ft., £2 15*s.*; 9 ft. by 6 ft., £3; 10 ft. by 7 ft., £3; 12 ft. by 8 ft., £3 5*s.*; 15 ft. by 10 ft., £4 5*s.*; 20 ft. by 10 ft., £5 5*s.*; 25 ft. by 10 ft., £6 5*s.* See page 186 in List.

COOPER'S HYGIENIC HEATER.

Burning Parafine or Gas without smoke or smell. These Heaters are constructed as a means of heating by Hot Air without the use of hot water or fires. Its peculiar construction economises the heat generated, so that there is no waste of heat or fuel. There being perfect combustion in this stove, and nothing whatever injurious to plants, but actually everything conducive to their health, it should be observed that plants may be had in full bloom throughout the severest winter. This cannot be obtained in stoves of other systems. The temperature can be regulated to a nicety to suit all requirements, being raised 15 degs. to 45 degs. above that of the outside. From 16*s.* complete. For full particulars, and prices of other sized Heaters, see ILLUSTRATED LIST, post-free on application.

THE RAPID PROPAGATOR.



The only perfect Propagator for raising Plants from seeds, slips, or cuttings:—

1 ft. 8 in. by 1 ft. 6 in.	£1	0	0

Analysis sent with orders of ½-cwt. and upwards.
SOLD BY ALL SEEDSMEN.

GISHURST COMPOUND, used since 1859 for Red Spider, Mildew, Thrips, Greenfly, and other blight; 2 ounces to the gallon of soft water; 4 to 16 ounces as a winter dressing for Vines and Orchard house trees, in lather from cake, for American blight, and as an emulsion when paraffin is used. Has outlived many preparations intended to supersede it. Boxes, 1*s.*, 3*s.*, and 10*s.* 6*d.*

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6*d.* and 1*s.*, from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

XL ALL LAWN SAND.

NOW IS THE TIME TO USE IT.

An exterminator of Daisies, Plantains, Docks, and other unsightly Weeds from Lawns, and a Fertiliser for the Grass combined in one. Guaranteed the finest and most effectual preparation ever offered for the purpose. Please note the following, from a well-known Gardener:—"The Lawn Sand which I had from you last autumn far exceeded my expectations in results. Used on a very weedy and impoverished part of the lawn, the same has this season been most conspicuous by the luxurious growth and absence from weeds. I have no hesitation in stating that whoever may give it a trial will also be satisfied with the result. — T. Turton, The Gardens, Maiden Erlegh, Reading."

A fine dry powder, supplied in air-tight tins:—2 lb., 1*s.*, 7 lb., 3*s.*; 14 lb., 5*s.*; 28 lb., 8*s.* 6*d.*; 56 lb., 16*s.*; 112 lb., 30*s.*
Carriage paid on 1 cwt. and upwards.
Full directions for use on all tins.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are always in a position to RECOMMEND MEN of the *highest* respectability, and *thoroughly practical* at their business. All particulars on application.
Telegraphic and Postal Address—"DICKSONS, CHESTER."

F. SANDER AND CO. can recommend several highly qualified and energetic HEAD and UNDER GARDENERS, of excellent character, and proved ability; men thoroughly fitted for all the various duties of their profession. For all particulars, please apply to—
F. SANDER AND CO., St. Albans.

Gardeners, Foresters, Land Stewards, &c.

JOHN DOWNIE, 144, Princes Street, EDINBURGH, can confidently recommend first-class Men as above, of excellent character and ability. Highest recommendations. Telegraphic address, "DOWNIE, EDINBURGH."

GARDENER (HEAD), seeks re-engagement where two or three are kept.—Age 25; highly recommended.—W. KNAPTON, The Gardens, Abernant, Aberdare.

GARDENER (HEAD), where several are employed.—Age 30; life-experience. Well recommended.—A. OWENS, St. Clere Gardens, Kensing, Sevenoaks.

GARDENER (HEAD).—Age 30, married; thoroughly experienced in all branches. Excellent references.—R. AND G. CUTHBERT, Southgate, London, N.

GARDENER (HEAD WORKING).—Age 30. J. H. AYLING, General Foreman for the last three years at Londesboro' Park, is desirous of obtaining a situation as above. Thoroughly versed in all departments. Well recommended.—Londesboro Park, Market Weighton, Yorkshire.

GARDENER (HEAD WORKING).—Age 49, married, no family. Life experience; thoroughly energetic, trustworthy, and efficient all-round; excellent character and testimonials; abstainer.—J. B., 18, Haldane Road, Fulham, S.W.

GARDENER (HEAD WORKING).—Age 37, married, no family; good practical experience in all branches. Cause of leaving, gentleman going away. Excellent character.—E. CROCKFORD, The Grange, Elstree, Herts.

GARDENER (HEAD WORKING).—Age 37, married, no family; life experience in good places. Can be highly recommended. Excellence in Fruit, Roses, Orchids, Chrysanthemums, and good all-round man.—GARDENER, Higham, Windlesham, Surrey.

GARDENER (HEAD WORKING), where three or four are kept.—Age 32; single; thorough life experience in all branches; first-class testimonials; disengaged.—J. W., 18, Cape Terrace, Witney, Oxon.

GARDENER (HEAD WORKING).—Age 42; married, no family; thoroughly practical in all departments. First-class character; disengaged.—MORRISS, 1, Grove Terrace, Leslie Grove, East Croydon, Surrey.

GARDENER (HEAD WORKING).—G. WILLIAMS, Esq., Fingest House, Henley-on-Thames, late of Lower Wyke Lodge, Worcester, can with confidence recommend his Gardener to any Lady or Gentleman. Thoroughly understands his work.—ALFORD, Lower Wyke Lodge, Worcester.

GARDENER (HEAD WORKING).—Age 40; no family; experience with Hothouses, Fruit, Flowers, Vegetables, Land, Stock, or Market Produce, or lay out new place.—READ, 7, Graham Road, Wimbledon.

GARDENER (HEAD WORKING).—Age 41, married, three children; thoroughly experienced in all branches. Land and Stock if required. Good references from present and previous employers.—J. BARLEYCORN, Walton, Leigh, Addlestone, Surrey.

GARDENER (HEAD WORKING).—Age 33; thoroughly experienced in all branches, seeks re-engagement as above. Excellent references.—A. C., Ceylon Villa, Southampton Road, Fareham.

GARDENER (HEAD WORKING), of three or more.—Age 31, married; sixteen years' experience in Gentlemen's establishments. Excellent character and references.—J. KEMP, Shalimar, Ewell, Surrey.

GARDENER (HEAD WORKING).—Twenty-one years' all-round practical experience in all its branches. Four and a half years' character from present situation. Not out.—W. L. ROBERTS, Wargrave Manor, Twyford, R.S.O., Berks.

GARDENER (HEAD, or good SINGLE-HANDED).—Age 30, married, one child; good practical experience in Vines, Greenhouse Plants, Flower and Kitchen Gardens. Excellent characters from good families. Disengaged.—HORTUS, 91, Wykeham Road, Reading.

GARDENER (HEAD, or good SECOND).—Age 27, single; twelve years' experience, Inside and Out. Good references.—R. A., Tandridge Court Gardens, near Redhill, Surrey.

GARDENER (HEAD, or SINGLE-HANDED).—Age 37, married; thoroughly experienced with Grapes, Peaches, Cucumbers, Tomatos, Flowers, and Vegetables of all kinds. Good character.—SHEPHERD, Dragon Street, Petersfield, Hants.

GARDENER.—Age 23, single; energetic. Abstainer. Life's practical experience. Glass, Flowers, Fruit, and Vegetables. Excellent testimonials and references. Lancashire or Cheshire preferred.—NEWBROOK, Floral Nurseries, Maidenhead.

GARDENER, thoroughly experienced in American Rose and Carnation culture, desires a Partner, or a position as Rose and Carnation grower. For further particulars and first-class references, N. J. ROSE, 45, Lucas Street, London, E.

£2 BONUS for anyone getting F. WELLS a situation as GARDENER (SINGLE-HANDED), or FOREMAN in good Establishment. Age 25, single; excellent character from last situation for abilities, &c.—6, Clyde Terrace, Forest Hill, S.E.

GARDENER (KITCHEN, or SINGLE-HANDED), or GARDENER and CARETAKER.—Age 28, married, no children; good references. Abstainer and non-smoker.—W. MITCHELL, Jetty Lane, Woodbridge, Suffolk.

GARDENER (good SINGLE-HANDED), or where help is given.—Age 26; abstainer. Thoroughly experienced, Inside and Out. Can be well recommended.—J. W. VICKERS, 10, Briars Cottages, High Barnet.

GARDENER (SECOND), where three or four are kept.—Age 23; seven years' experience Inside and Out. Good references.—F. DOUCH, Park Gardens, Winchcomb, Glos.

GARDENER (SECOND), in a good establishment.—Thorough good all-round practical experience, Both Inside and Out. Nearly five years' excellent character.—H. THOMSON, 120, Albany Street, Regent's Park, London, N.W.

GARDENER (SECOND), where more are kept.—Age 25; well up Inside and Out; well recommended, four years' excellent character from last situation.—A. T., Tunnel Cottage, Winchfield, Hants.

GARDENER (UNDER, or SINGLE-HANDED).—Young man, age 22; seven years' experience. Good references as to character.—A. FISHER, 3, School Lane, Wargrave, Twyford, Berks.

GARDENER (UNDER, or SINGLE-HANDED).—Age 23; six and a half years' experience. At present Journeyman.—G. J. BEST, 11, Leonard Road, Forest Gate, London, E.

GARDENER (UNDER).—Age 21; kitchen garden and pleasure grounds, and assist in the Houses when required. Six years' good character from present place.—GEORGE BOTWRIGHT, The Lodge, Dennington, Suffolk.

GARDENER (UNDER), Inside, or Inside and Out.—Age 22; strong, willing, and obliging. Four years' excellent character.—F. CANNON, Barrow Point Gardens, Pinner, Middlesex.

GARDENER (UNDER).—Age 21; experienced Inside and Out. Can be well recommended by present employer; leaving through place being sold. Good references.—T. SHEARMAN, Mrs. Burtt, The Brows, Malton.

GARDENER (UNDER).—Age 21; experienced Inside and Out; strong and obliging. Good character from last employer.—E. WHITEN, 5, Hampden Road, Grays, Essex.

To Nurserymen.

MANAGER or FOREMAN (Outside).—Fruits, Roses, Ornamental Trees, or general. Age 41. Twenty-seven years' experience, fourteen years as Foreman here. Good character. Reply, stating wages, &c.—GEORGE DAVIES, American Nurseries, Downham, Norfolk.

W. G. BAILEY, fifteen years MANAGER and GROWER for Mr. P. Ladds, is open to an engagement in the same. Well recommended.—3, Livingstone Villas, Swanley Junction.

COLIN KILMISTER, late of Maudlin Nurseries, Steyning, seeks engagement as PROPAGATOR and GROWER of Pot Roses. Age 24; eight years' experience.—56, Buckingham Road, Brighton.

FOREMAN, in the Houses, in large establishment.—Age 29, single; good character from last situations in large establishments as Foreman.—W. WRIGHT, Tilbury Hill, Halstead, Essex.

FOREMAN (INSIDE, or GENERAL).—Age 28. Mr. G. R. GEORGE, Gardener to Earl Sondes, Lees Court, Faversham, wishes to recommend his late Foreman and Decorator as above. Three years as Foreman previously.—Present address, G. W. RAYMENT, Poles Park, Ware, Herts.

FOREMAN.—Age 25; life experience. Can be well recommended by past and present employers.—A. M., 4, Southlands Road, Bromley, Kent.

FOREMAN.—Age 26; eleven years' practical experience Inside and Out; house and table decoration. Good references. Disengaged November 10.—GREENLEES, Leed's Castle Gardens, Maidstone, Kent.

KNIFEMAN.—Age 23; over eight years' experience in the Budding, Grafting, and Growing of Fruit Trees, Roses, Conifers, Hollies, Ivies, Rhododendrons, Clematis, general Soft-wooded Propagation, &c.—J. BATY, Two Dales, near Matlock.

JOURNEYMAN (GENERAL); age 22.—Young Man desires situation as above. Good experience Inside and Out. Leaving through reduction. Well recommended.—J. M., Mr. G. Trusler, Nurseryman, Feltham, Middlesex

JOURNEYMAN, or SECOND.—Three years' character; seven years' experience.—ARTHUR DURBIDGE, Bramley, Basingstoke.

JOURNEYMAN, in the Houses.—Age 21; six and a half years' experience in Fruit and Plant Houses, Chrysanthemums, Wall Trees, &c. First-class references. Abstainer.—C. JONES, Eastrop, Highworth, Wilts.

JOURNEYMAN; age 20.—J. CYPHER begs to recommend a man as above. Five years' experience. good knowledge of Plants, including Orchids.—Exotic Nurseries, Cheltenham.

TO GARDENERS, &c.—A young man, age 19 last August, wishes for a situation under a Head Gardener, or at a Florist's. Has been gardener's boy in a gentleman's house, and with a nursery gardener. Very good references.—C. BULL, 4, Claremont Terrace, Lewisham, S.E.

TO GARDENERS, &c.—A young man (single), seeks situation to look after a few Cows, and fill up time in Garden. Good reference.—E. TROTT, 26, Catherine Road, Highcliffe, Winchester.

TO GARDENERS.—A young Man, age 20, seeks situation as IMPROVER, Inside, or Inside and Out. Left through death. Good character.—W. TEE, Down End, Fareham, Hants.

TO GARDENERS and FLORISTS.—Man, age 24, wants situation as SECOND, under Glass. Good references. Nine years' experience.—T. J., Belmont, Banchory Road, Blackheath.

TO NURSERYMEN.—Young Man (age 19); well-up to Potting and Watering of Bedding and Greenhouse Stuff. Good reference.—ARTHUR BROWN, The Gardens, Wray Park, Reigate.

NURSERYMEN and FRUIT GROWERS.—Wanted charge of Department, or could work a branch. Interest in the same if desired. Practical, energetic; highly recommended.—S. M., 41, Wellington Street, Strand, W.C.

TO NURSERYMEN and FLORISTS.—Young man requires situation as above. Four years' experience. Good make up. Little knowledge of Seed Trade. Good references.—HY. BAILEY, Colyford, Devonshire.

TO NURSERYMEN and FLORISTS.—Young man of five and a half years' experience in Houses seeks re-engagement. Well up to Mounting, Furnishing, &c. Good references.—A., 38, King Street, Twickenham.

TO FRUIT GROWERS.—MANAGER. Wanted by a thorough practical, life-experienced, middle-aged Man, a situation as Manager on a Fruit Farm. Thorough experience in all out-door Fruits, and Glass-houses, good experience of Land and Stock. Thirteen years in present situation on Lord Sudeley's Fruit Farm (since its formation); excellent character from this and former situations.—D. SHEPPARD, Toddington, Winchcombe, R.S.O.

TO SEED GROWERS and NURSERYMEN.—A young Man (age 30) wishes to obtain a thorough knowledge of Nursery Work; also in Houses.—HATCHGATE, Blindley Heath, Surrey.

Seed, Bulb, and Horticultural Trade.

BOOK-KEEPER and CASHIER.—Experience in County Court Procedure, Invoicing, Correspondence, Shorthand, Southern and Eastern journey. Age 26. Highest references.—LIBRO, 6, Market Place, Bexley Heath.

HEAD SHOPMAN, or TRAVELLER.—Wanted, by a highly respectable young Man, age 30. Seventeen years' experience in the Seed Trade in all its branches. Ten years in present situation; highest references.—S., *Gardeners' Chronicle* Office, 41, Wellington St., Strand, W.C.

SEED TRADE.—HEAD SHOPMAN open to re-engagement, thorough knowledge of all branches of the trade, long experience.—Apply, B., Mr. W. B. Hartland, Seed Merchant, Cork.

SEED TRADE.—SHOPMAN, or ASSISTANT, age 26. Nine years' experience in all branches of the Trade, Scotch and English Houses. Five years in present situation. Excellent references.—A. J., 6, Dollar Street, Cirencester.

SHOPMAN or ASSISTANT, in a general Nursery, Seed, and Florist Business.—Age 24; nine years' experience in Retail and Wholesale Trade.—A. B. C., 41, Wellington Street, Strand, W.C.

BOOK-KEEPER, or CLERK, in Seed Trade.—Over twenty years' experience.—E. FLETCHER, 16, Clarendon Road, Crumpsall, Manchester.

SEEDSMAN (JUNIOR ASSISTANT).—Age 21; four years' experience.—All particulars from HOWDEN AND CO., Inverness.

TO FLORISTS.—A young Lady desires re-engagement; five years' experience. Thorough knowledge of the business in all its branches. Good references.—A. TODD, Worlton Wood, Liverpool.

"SAFE AS THE BANK OF ENGLAND."—The phrase is familiar enough, and in spite of recent criticisms of our great national institution, most of us would be perfectly content if all our private ventures were "as safe as the Bank of England." Well then, you must look after your financial soundness as well as you can; and if you are not quite sound in health, take my advice. For all complaints of throat, chest, liver, and stomach; for coughs, colds, influenza, bronchitis, and the like, you will find in HOLLOWAY'S PILLS and OINTMENT a cure "safe as the Bank of England.' They are a sound investment, as proved by a trial extending to nearly sixty years.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S

PATENT SELF-ACTING HYDRAULIC RAMS,

FOR RAISING WATER FOR THE SUPPLY OF TOWNS, VILLAGES, IRRIGATION, RAILWAY STATIONS, MANSIONS, FOUNTAINS, FARMS, ETC.

No cost for Motive Power, which is obtained from a Stream of Water passing through the Ram. No Oiling or Packing required. Made in sizes to raise from 300 to 300,000 gallons per day. Will force to a height of 800 feet.

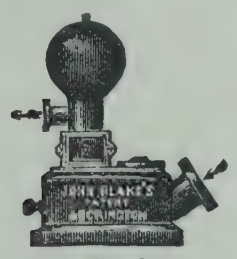

Fig. A.
This Ram raises a portion of the same water that works it.

This View represents a Ram worked by impure river water, whilst pumping pure water from a well or spring and forcing it to a small reservoir on the hill, at an elevation of 295 feet and a distance of one mile, from which reservoir the water is gravitated for fire-extinguishing and general requirements of mansion, stables, farm, and village.

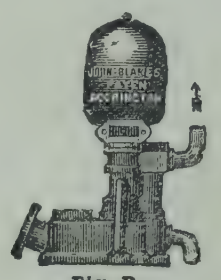

Fig. B.
This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

TESTIMONIALS.

From T. FERNYHOUGH, Esq., Agent to The Right Hon. LORD HINDLIP.

Bradley, Ashbourse, Derby, March 17, 1894.

DEAR SIR,—Referring to the two Patent "B" Rams you started six months ago for the Right Hon. Lord Hindlip, on the Alsop-en-le-Dale Estate, I am glad to congratulate you on the success of your attempt to raise the necessary supply of water under conditions so difficult, the height to raise the water being more than **63 times that of the working fall.** The Rams are worked by water from the River Dove with the small working **fall of 8 feet 3 inches,** and issuing from the rocky bank close by is a copious stream of pure spring-water, **8000** gallons per day of which the Rams force to a reservoir three-quarters of a mile distant, and at the extraordinary height of **532½** feet above the Rams. The water is then gravitated from the reservoir to the several farms and houses on the estate, giving an ample supply to each, and still leaving a good overflow at the reservoir.

I am glad to add that the Rams lift more water than you promised, and seem to work with great ease and smoothness, notwithstanding the great elevation they force to.

Yours faithfully, T. FERNYHOUGH.

From T. DYNE STEEL, Esq., M.Inst.C.E., Past President South Wales Inst. of Engineers, Bank Chambers, Newport, Mon., April 24, 1891.

USK WATERWORKS.

DEAR SIR,—In September of last year I applied to you for a Hydraulic Ram for the purposes of the Usk Waterworks, to be capable of raising 27,000 gallons per day, a height of 127 feet, with a working fall of driving water of 27 feet, and on your guaranteeing that performance I gave you an order for the Ram. The machine you supplied has now been put to work, and I have much satisfaction in saying that it far and away exceeds in its performance my most sanguine expectations, and possibly yours also. I have just completed a series of exhaustive tests with the following results: Working fall of driving water, 30 feet; vertical height raised, 127 feet; length of rising main, 850 feet, from Ram to outflow; length of supply pipe, 200 feet; gallons per hour raised, 1612; driving water used per hour, 8186 gallons, showing the remarkable and gratifying result of **83 per cent. of efficiency.** The tests were carefully made and repeated, the water measured, and levels properly taken. Several trials were made, and I shall be glad to give any engineer interested in the subject, facilities for repeating the tests at the spot. I may here state that for the rising main I used a large diameter of pipe in order to reduce friction, with excellent effect. Yours faithfully, T. DYNE STEEL.

From the Hon. The Earl of HARROWBY, 44, Grosvenor Square, London, February 21, 1893.

SIR,—I have pleasure in stating that the two Hydraulic Rams, which you supplied and fixed for me last autumn, at Sandon, have proved so far most successful, and that the work gives every promise of durability, while the economy, compared with the former much smaller and intermittent supply by steam-pump, will be considerable.

With a fall of about 14 feet from a previously existing mill-pool, the Rams supply reservoirs 168 feet above the brook whence the water is forced, through pipes 1½ miles in length. They sent up, as long as I required it, about 41,000 gallons per day. I now generally work the two Rams alternately (for a fortnight or so each), but can at any time work the two together, if the full supply of 41,000 gallons should be needed.

The business of this somewhat complicated water-supply was conducted by you with singular promptness and punctuality; and no local difficulties arose in the execution of the work, owing to the excellent and efficient men whom you sent from your works at Accrington.

I am, Sir, your very obedient servant, HARROWBY.

From CHARLES HART, Esq., A.M.I.C.E., 3, Avenue Road, Leamington, March 13, 1893.

BRIXWORTH UNION RURAL SANITARY AUTHORITY, EAST HADDON WATER SUPPLY.

DEAR SIR,—Since the opening of these works in May, 1891, the two double-acting "B" Rams supplied and fixed by you have done their work with a minimum of attention, uninterruptedly and satisfactorily. Pure spring water obtained from a gathering-ground on the side of a hill is carried along iron pipes a distance of 548 yards, down to a cistern fixed in the Ram-house. From this cistern it flows to the Rams, which are driven by impure water—drawn from an adjacent brook, with an available fall of 12 feet—and thence by them forced along an ascending delivery pipe, a distance of 1520 yards, to an iron reservoir, at an elevation of 204 feet. From this reservoir mains are laid which supply the hall with its stabling, the rectory, six farm-houses, two dairies, and twenty-four wall-fountains for the villagers' use.

The average daily consumption exceeds 4000 gallons, which one Ram easily delivers, thus exceeding your guaranteed quantity by more than 1000 gallons per Ram per 24 hours. Generally the two Rams are regulated to divide the work between them, but occasionally it devolves upon one only.

If more widely known, this means of supplying villages and small towns with a limited quantity of spring water, forced to a suitable elevation by means of your Rams driven by impure water, would most certainly be more generally adopted.

Yours faithfully, CHARLES HART.

From C. PAGE WOOD, Esq., Wakes Hall, Wakes Colne, Essex, January 11, 1889.

SIR,—In reply to your inquiry, the Hydraulic Ram you put down for me in 1884 has cost me only 6*d.* in repairs (for a new stud my blacksmith made); the second Ram you put down to supply an off-hand farm has been running three years, and has cost not a penny for repairs; the third and largest Ram you put down two months ago, which is for the supply of water to my neighbours, is running satisfactorily. All three Rams throw up more water than you guaranteed. From inquiries I have made from friends who have Rams of other makers, I am convinced of the superiority of yours, and my third order is a proof of my good opinion. My abundant water-supply is the greatest possible comfort to me. Yours faithfully, C. PAGE WOOD.

From Sir S. M. MARYON WILSON, Bart., London, Nov. 17, 1891.

SIR,—I have much pleasure in stating that the two "A" Rams you supplied and fixed for me at Searles, on my Sussex estate, have proved a great success, especially when the small supply of driving water is considered, as with a supply of 7 gallons per minute only, they have daily thrown 3000 gallons to a height of 96 feet, and through a service of pipes over a mile in length; and testing them recently (with plenty of driving power) found they lifted 7000 gallons per day.

The economy effected by their use is considerable, as they have entirely superseded a steam pump.

S. M. MARYON WILSON

From MATTHIAS SMITH, Esq., Hill Top Hall, Pannal, near Leeds, January 14, 1889.

DEAR SIR,—I have great pleasure in bearing testimony to the marvellous efficiency of the Ram you fixed here in January, 1888. It is worked by spring water of irregular volume, the dry weather flow being six pints per minute, with which quantity you promised to work the Ram, forcing through 330 yards of delivery pipe to an elevation of fully 144 feet, but out of 5¾ pints per minute, 166 gallons per day are sent up, and out of 2 gallons per minute now flowing through the Ram, 540 gallons per day are delivered at the same height. Considering the extremely small quantity of driving water, I certainly did not expect so grand a result. With every wish that you may get the reward you deserve,

I am, dear Sir, yours faithfully, MATTHIAS SMITH.

JOHN BLAKE, RAM WORKS, ACCRINGTON, LANCASHIRE.

DICKSONS, CHESTER.

TO THE TRADE, 1894-5.

JAMES VEITCH & SONS

Beg to direct special attention to the following Sterling Novelties :—

NEW TOMATO—FROGMORE SELECTED.

(*First-class Certificate, Royal Horticultural Society, April* 24, 1894).

This exceedingly fine variety was raised by Mr. Thomas, The Royal Gardens, Frogmore, and is the best Tomato yet introduced. The fruit is of good medium size, and a deep bright red colour, smooth and almost round, very firm and solid, with flesh of unusual depth. It is a most prolific and continuous cropper. For early forcing this variety is unequalled, and having ourselves grown it extensively during the past season, we confidently recommend it as a very desirable sort. It is also very suitable for outdoor cultivation. Mr. THOMAS, writing August 27, says :—"You will be pleased to hear that it is an excellent variety for outdoor culture. It has been tried here this season side by side with all the best sorts recommended for this purpose, and it has proved itself to be by far the best of any I have grown."

Per Packet, 2s. 6d.

NEW MELON—INGESTRE HYBRID.

(*Award of Merit, Royal Horticultural Society, May* 8, 1893)

This high-class seedling was raised by Mr. Gilman, of Ingestre Hall Gardens, and is the result of a cross between Hero of Lockinge and The Countess, two well-known varieties of superior quality. The fruit is globular in shape, of medium size, and a bright golden-yellow, most beautifully netted, with very thin skin. It has great depth of flesh, which is almost white, very sweet and juicy, and the flavour superb. The plant is of robust constitution, and a very free setter.

Per Packet, 2s. 6d.

CAMPANULA PYRAMIDALIS COMPACTA.

(*Syon House variety.—Award of Merit, Royal Horticultural Society, August* 9, 1892.)

Raised by Mr. Wythes, and quite distinct from the older form, being dwarfer, the flowers larger and deeper blue, with more substance. The plant is of dwarf pyramidal habit, exceedingly free-flowering, and clothed with foliage to the ground. The growth being strong and erect, staking may almost be dispensed with. As a decorative plant, this variety is invaluable, the plants being covered with bloom, which lasts a very long time.

Per Packet, 1s. 6d.

STREPTOCARPUS—VEITCH'S NEW HYBRIDS.

This popular greenhouse plant has been brought to a very high state of perfection by careful culture and hybridization, and the seeds now offered are selected from plants far in advance of the older varieties—in richness of colour, size, and form of flower, containing only the most distinct and rarer shades, particularly amongst the purple, purplish-violet, bright red, deep rose, and rich rosy-purple. The whites are more pure, and the markings on the throat more defined. **Per Packet, 2s. 6d.**

PRICES TO THE TRADE ON APPLICATION.

NEWTON WONDER

(FROM PHOTOGRAPH, MUCH REDUCED).

This fine Apple was exhibited by us before the Fruit Committee, R.H.S., December, 1887, and was

Awarded First - class Certificate.

It has now been grown long enough for its merits to be well proved, and there can be no doubt that it is the Finest Late Culinary Apple in cultivation. It is a

MAGNIFICENT GROWER, EARLY & GREAT CROPPER,
AND HAS
NEVER BEEN KNOWN TO CANKER.

The Fruit is heavy, and of fine flavour when cooked, and it will keep until Apples are ready the following season.

Having a large Stock, we have this year

REDUCED THE PRICE,
AND ARE
PREPARED TO OFFER IT BY THE THOUSAND TO MARKET GROWERS.

We shall be pleased to show our Stock of these, and

OTHER FRUIT TREES,

to visitors, and feel sure that an inspection will give pleasure.

OUR NURSERIES have for three generations been known for the careful cultivation of fruits, and have established a reputation for sending out Trees **TRUE TO NAME**. Our Stock this season consists of over **300,000 Saleable Trees** in all forms. **Espalier-trained Trees** are a specialty; we have **Apples, Pears,** and **Plums** in this form, which cannot be surpassed, of almost any size. **Cordon Apples, Pears,** and **Plums, Fan-trained Plums, Peaches,** and **Nectarines, Apricots, Cherries,** &c., for walls. **Apples,** as **Bushes** and **Pyramids,** upon our selected Paradise stock, for villa gardens or market work. **70,000** of all sizes, and all the leading kinds, including **Best Novelties. Standard Apples, Pears, Plums, Cherries, Medlars, Quince,** &c. Small fruits in every variety.

☞ *CATALOGUES, FREE UPON APPLICATION.*

NEW AND BEAUTIFUL HARDY SPIRÆA.
SPIRÆA ANTHONY WATERER.

This is a sport from the well-known Spiræa bumalda, from which it differs only in colour, the flowers being a rich crimson, borne in large corrmbs thickly on the plant.
It is a continuous bloomer, and is without doubt the most important addition to hardy flowering plants of many years.
FIRST-CLASS CERTIFICATE,
Royal Horticultural Society of London.
Nice plants, 7*s.* 6*d.* each, will be distributed in November.

Williams'
STERLING NOVELTIES
For 1895.
Our own introductions, now offered for first time.

PRIMULA SINENSIS FIMBRIATA
"SNOWBALL" (New).
THE NEW GIANT STRAIN.
It is, without exception, the finest White Primula in cultivation, and we feel confident that it cannot fail to give satisfaction wherever it may be grown. It is more vigorous in growth than the old varieties, the foliage being remarkably strong. The flower stem is very sturdy, rises well above the foliage, and bears a profusion of massive flowers of a pure white colour of great substance. The individual blooms measure 2½ inches in diameter, and are exquisitely fringed. *Per Packet*, 5*s.*

TOMATO, WARDEN PARK FAVOURITE
(New).
The raiser describes this as a fine variety for winter work; grown in pots it will fruit when scarcely 6 inches high. The fruit is of medium size, ribbed, and of a bright red colour. It is a very free setter, and a good bearer.
Per Packet, 1*s.* 6*d.*
Special Terms to the Trade on application.

BICTON.

FEW who know South Devon, and more particularly that part lying between Exeter and Sidmouth, can have failed to have heard of, if not actually to have seen, the beautiful gardens at Bicton, the charming home of the Hon. Mark Rolle. But as there are many who, not only have never been to South Devon, but have failed to go west at all, it has occurred to me that a short description of the gardens at Bicton may be of interest to some who read these pages. Bicton adjoins the long, straggling village of Otterton, and is distant from Sidmouth some four miles, the walk, west from Sidmouth, along high cliffs of massive red sandstone, and down into typical Devonshire lanes, where banks are carpeted with Hart's-tongue and other Ferns, being not the least pleasant part of the excursion. Certainly no snugger retreat, for all that is choice and delicate in plant life, could be found than the Bicton Gardens. A gentle southern slope, in a latitude where snow is rare and frosts comparatively mild — though even here we noted marks of the ravages of last winter, and the influence of a sea-tempered air, go to form a perfect site for what we find there. What strikes one, upon a first view of the gardens is, the scrupulous neatness and order of the *tout ensemble*. Not a weed visible anywhere, well-kept lawns, carefully tended hothouses, and that unspoken, but unmistakable tone about the whole that tells one that the garden is dear to the owner. The house is comparatively modern, and of little interest, but the park is rich in groups of magnificent forest trees, Beech, Elms, and Ashes; and boasts what is, perhaps, unique in England, a fine avenue of Araucaria imbricata, all grand trees of considerable age.

On presenting our tickets of permission to view, the head gardener led us through the glass-houses, bright with flowers many of them, and all containing some curiosity in plant or creeper. In the Palm-house we noticed some very grand trees, almost reaching to the summit of the exceptionally-lofty roof, and all in the most perfect condition. Orchids did not seem to be grown in any quantity, but stove plants were particularly well represented, and gave forth quite a glow of rich colour. A long row of pits contained Pines, some nearly ready for cutting; whilst the late vinery (it was then mid-September) showed a grand crop of Lady Downe and Black Alicante Grapes; there were, too, a few bunches of Gros Colmar still hanging. The gardens are laid out in terraces, sloping down, across green lawns, dotted with beds of every variety of flowering shrub and plant, to an artificial miniature lake, where fountains play, the background formed by a broad grass-drive, walled in by fine trees, and looking like a tilting-ground of ancient time, trending upwards to the park, a vista of which we catch as we pass

along a broad walk towards the church. The paths on either side, leading down to the lake by broad steps, are flanked by walls literally covered with Magnolia, the finest we have ever seen. We were shown several specimens of the Cabbage-tree, Dracæna, a native of New Zealand, we believe, which had suffered by last winter's frosts, having thereby lost their leaders. All seemed alive, however, and were breaking out, in a curious Kale-like growth, all up the stem. It seemed curious that this tree, considered quite hardy, should suffer, whilst Hydrangeas easily winter here in the open. The terrace facing the lake was ornamented with carefully-trained standard Myrtles, and about the lawns were statues, copies from Greek antiques. The fernery lay away to the left of the garden, and contained almost every species of British Fern. A delightfully cool spot this, on a hot summer day; roofed over by tall trees, a mass of living green and, just audible, the gentle falling of the tiny fountain, plashing its waters in the pool below. Huge boulders of stone, brought from near Sidmouth, one originally part of an ancient cromlech, formed the rockwork, and over these, in great profusion, grew Osmunda, Parsley Fern, Hart's-tongues, and a dozen others, whilst we even noticed a plant of real Maidenhair, presumably a hardy variety. Thick clumps of Bamboo helped to screen the sun from the moisture-loving plants. Strolling leisurely along, out into the sunshine again, we were guided into what was perhaps the most impressive part of all. Literally, acres of broken ground, planted in perfect taste, with the most magnificent Conifers it has ever been my pleasure to see. Here were isolated examples, grown to perfection, of the stately Pinus excelsa, and Pinus insignis; dark-foliaged Cupressus, dwarf Juniperus, the giant Abies Douglasi, and many others of the Spruce family—all labelled clearly and distinctly, so that the visitor "who runs may read," without much trouble. Then again, grand specimens of the wide-spreading Cedrus Deodara and Libani, and massive Arbor-vitæ claimed attention; whilst here and there, carefully guarded from the attacks of rabbits, were some lately-planted shrubs of rarer species. The walk took us upward to a large lake, where swans and the shy "bald" coot took their pastime, and where water-loving trees and shrubs grew close to the margin; and then away up a broader drive, overhung by drooping Limes, we were courteously conducted to the gate, and our visit to Bicton was over. *Market Gardener.*

New or Noteworthy Plants.

ECHIDNOPSIS DAMMANNIANA.

For many years the curious genus Echidnopsis contained but one known species; in 1892, however, Messrs. Dammann & Co. of Naples distributed a second species (E. Dammanniana), whilst last year a third (E. Virchowi) was added to the genus. Two of them have been properly described, but of E. Dammanniana no botanic description has yet been published, and as a specimen of it was kindly sent to Kew in August last by Messrs. Dammann & Co., I here give a description of the plant, and take the opportunity to make a few remarks upon the genus.

Echidnopsis is a genus of Asclepiadeæ belonging to the tribe Stapelieæ, that was separated from the rest of that group on account of its tesselated stems, and absence of an outer corona. The two recently-added species, however, have a corona identical in type with that of Caralluma, and it becomes a question as to whether Echidnopsis should be retained as a distinct genus, or merged in Caralluma; indeed, after an examination of many hundreds of flowers of very many genera, it becomes a very difficult question to decide on what characters many of the genera of Asclepiads can be maintained. A great number of genera have been founded upon slight modifications of what is essentially the same type of corona, and others on habit only. In Echidnopsis the habit and appearance of all the species is identical, but the corona shows two types of structure. In the original species, E. cereiformis, the corona consists of five simple lobes incumbent on the backs of the anthers, with no evident outer coronal lobes; these are, however, represented by very minute rudimentary denticles between the coronal-lobes at their base; but in the other two species the outer coronal lobes (i.e., those lobes or outgrowths from the staminal-column, which alternate with the anthers, and are opposite to the lobes of the corolla), are distinctly evident, and either unite the inner coronal-lobes together into a sort of cup by a series of five small pouches, or project between them as five small lobes, this being the same as the coronal structure of Caralluma, and as the corolla also agrees with that genus, there is no character to distinguish these two species of Echidnopsis from Caralluma, except that the stems are cylindric, with six to eight tesselately-divided angles, instead of being square or five-angled; but as this peculiarity is common to all the species, and they are very readily distinguished from all species of Caralluma by their stems alone, it will be perhaps more convenient to keep them generically distinct from Caralluma, until further discoveries shall render this character invalid also. At the same time this character is certainly a very artificial one, since in other genera with succulent stems, such as Cereus and Euphorbia, there are all modifications from three, four, five, to many angled stems. As to the coronal modifications, there is one species of Caralluma in which the outer corona is sometimes present and sometimes absent, whilst in Asclepias and Xysmalobium, which have no evident outer corona, it is represented in several species by minute rudimentary denticles, just such as are present in Echidnopsis cereiformis. Prof. Schumann has correctly stated (*Monatschrift für Kakteenkunde*, 1893, v. 3, p. 98) that in Echidnopsis the flowers spring from the grooves between the angles of the stem, but adds that in others of the Stapelia tribe they arise from the axils of the tubercles; this, however, is an error, as I have seen and examined in a living state hundreds of flowers belonging to this group, and have never found one that truly originated from the axil of a tubercle! In a few species of Caralluma the flowers are subaxillary or in terminal umbels, but in all the rest they always arise—and I believe, by dichotomy—from the grooves between the angles, although usually a little to one side of the middle of the channel. The following is a description of the specimen sent by Messrs. Dammann & Co.:—

> Habit as in E. cereiformis, stems succulent, $\frac{5}{8}$ to $\frac{3}{4}$ inch thick, cylindric, obtusely 8-angled, the angles tesselately divided into small obtuse tubercles by impressed transverse lines, dull greyish or purplish-green, glabrous. Flowers in fascicles of three to five in the grooves between the angles, subsessile, but developing pedicles about one line long when in fruit. Sepals $\frac{3}{4}$ line long, ovate acuminate, glabrous, very minutely papillate. Corolla rotate, $3\frac{1}{2}$ lines in diameter, the lobes $1\frac{1}{4}$ line long, 1 line broad, ovate, acute, glabrous, papillate outside, dark purple-brown, with the central part yellowish, dotted with purple-brown. Outer corona of five small concave lobes, that radiately spread out between and beyond the bases of the inner coronal-lobes and have their sides more or less pinched together at about the middle. Inner coronal-lobes half a line long, deltoid-acuminate, incumbent on the backs of the anthers, the entire corona dark purple-brown, glabrous. A native of Abyssinia. E. Dammanniana, Sprenger, in *Dammann Cat.*, 1892, p. 4, f. 5; *Wiener Illustrirte Gartenzeitung*, 1892, p. 351, f. 59; *Gartenflora*, 1892, p. 526, f. 107.

In the *Wiener Gartenzeitung* for 1892, it is stated that this plant finds a ready sale in Vienna, whilst Cacti, which have far more attractive flowers, are not to be seen in the market. *N. E. Brown.*

Orchid Notes and Gleanings.

SOPHRONITIS CERNUA.

This pretty species, on which Lindley founded the genus Sophronitis, is not held in such esteem in gardens as S. grandiflora, but how pretty it can be when properly grown is well exemplified at Messrs. W. L. Lewis & Co.'s nursery, Chase Side, Southgate, by a number of plants bearing sprays of light scarlet-coloured flowers. Mr. Ashton, the managing partner of the firm, has a partiality for neat-growing and pretty species of Orchids, such as Sophronitis, Pleiones, &c., and he is very successful in their cultivation, as is shown by the bright array of their flowers, together with those of Cattleya labiata and other species in these nurseries at the present time.

Odontoglossum crispum from Arddarroch.

Some flowers of a very distinct and pretty type of Odontoglossum crispum, some of them being charmingly spotted, have been received on several occasions from R. Brooman-White, Esq., Arddarroch, Dumbartonshire, who refers to this strain, which has been imported direct, as differing from other importations he has witnessed. In shape the flowers more nearly realise the florist's ideal than those of the best old variety, but they are scarcely so large; the white is also very pure, and the lip is invariably of a nearly oval-shape, like that of O. c. Lehmannii, and beautifully and evenly crimped at the edge. A very neat, handsome, and compact inflorescence is the invariable rule with this strain.

Odontoglossum Pescatorei, *Raphael's var.* (*n. var.*)

Variation in O. Pescatorei is not nearly so common as in O. crispum, and often when a really fine variety does appear, there is nothing about it which warrants a varietal name. But the present beautiful form which has flowered in the collection of G. C. Raphael, Esq., Castle Hill, Englefield Green, is not only remarkable on account of the size, breadth of the segments, and other characteristics of an unusually fine flower, but the broad labellum is so richly and quaintly marked that the variety can be readily distinguished by it. The crest is orange-coloured, changing to chrome yellow at the side, the upper portion being streaked with red. On each side of the lip from the base runs a broad irregular band of rich purple, the bands nearly meeting in front of the crest, and then diverging right and left over the front lobe. The space between these lines at the apex of the lip is filled by a diamond-shaped purple blotch. The margins of the side lobes and the sides of the front lobe of the lip are white, the whole lip being strikingly beautiful. *James O'Brien.*

MOMORDICA MIXTA.

The magnificent Gourd shown from Kew under this name at the last meeting of the Royal Horticultural Society, attracted much attention from its brilliant coral-red or crimson colour. Our illustration (fig. 70), shows the fruit of its natural size, studded with short conical spines. It is a native of India, Cochin China, &c., and was figured in the *Botanical Magazine*, t. 5145, and in the *Flore des Serres*, 14, 1478. According to the *Kew Index*, M. cochin-chinensis is synonymous, but under whatever name it may be known, it must be admitted to be one of the most splendid tropical climbing plants.

The flowers are described as four inches across, with five ovate lanceolate sepals with black stripes, and a bell-shaped, pale yellow corolla, with a purple eye. The leaves are cordate, palmately lobed, and their stalks are provided with cup-shaped glands. Judging from the acrid properties of its nearest allies, we should hesitate to consider this plant in any other light than as an ornamental one.

Fig. 70.—FRUIT OF MOMORDICA COCHIN-CHINENSIS SYN. MIXTA: FRUIT REDDISH-CRIMSON. (SEE P. 530)

STREPTOCARPUS.

I have during the past two years grown a good batch of this little-known plant, with the idea that by selecting the seedlings with decided colours it would be possible to get flowers of a larger size, with more substance in the petals, and more decided colours. Of course, with only a limited quantity, and those raised from seed yearly, it cannot be expected that any private grower can get plants like those grown at the Chelsea nurseries. I was informed there that many of them had been flowering continuously for six months, and were very beautiful at the time of my visit (September 29). The newer seedlings are very superior to the older or earlier introduced varieties, and though our own seedlings at Syon are good, especially the violet forms, we have not the red and crimson types of bloom so good at Chelsea. These reddish forms are a great gain, and quite distinct from the original hybrids, as in them the light and dark blue predominated, and the newer shades are so beautiful that they will be much admired by those who do not care only for size. At Chelsea I counted no fewer than nineteen distinct colours, from pure white to darkest purple, the white flowers with violet markings being beautiful. The magentas and crimsons were very rich in spot and throat markings, and the light and dark blues were equally brilliant. I consider these plants specially suitable for the decoration of the greenhouse, and as during the summer months there are none too many small flowering plants for decorative purposes, they are most useful, as they last so long, and give so little trouble. The value of the plants may not be great where cut flowers are in demand, their chief recommendation being their utility for house decoration, and their long lasting or flowering properties. During the past year there have been great strides in size and in the production of colours not seen in the earlier forms. I intended heading my note "Streptocarpus in Autumn," but though they are little grown for autumn bloom, I have obtained plants from a later or April sowing that are a mass of bloom at this date, and I do not see why they should not be as useful as the Primula at this, the dull season. I have always sown the seed early in January, and got the plants to bloom in June, but by making two sowings I get a succession and a late or winter lot of plants invaluable for decorative purposes during the winter months.

A few words as to culture may not be out of place. Many persons consider the plants difficult to raise, but such is not the case, and many fail by growing them in too much heat; indeed, the treatment given to the Primula at the start is a suitable one for these plants also. Early this summer I saw Streptocarpus planted out in a shady corner, showing that strong heat is not necessary, but I am not sure how such plants will winter. I do not think they will stand our variable winters, but they do well in summer. The plant, being a greenhouse perennial, will give a lot of bloom the second season after sowing if shifted into larger pots, and a larger proportion of loam be used in the compost. By sowing as advised early in the year, strong plants for autumn bloom may be obtained; the seed being very small, it is advisable to sow in small pans in a compost of two-thirds fibrous loam and one of peat, with a liberal quantity of sand, the soil having a fine surface. The soil should be thoroughly moistened previous to sowing the seed, and after sowing, let it be covered with glass or paper, and placed in a temperature of 70° till the seedlings appear above the surface. Then place them near the light, and prick-off into small pots, placing several plants round the sides of the pot, and growing on in a warm house, potting into 60-pots, and again into 48's when the plants are large enough, using a larger proportion of loam and good leaf-mould at the latter pottings. If there is suitable rockwork that is not liable to catch the drip from plants above, Streptocarpus turned out of small pots do well planted there, and have a very pretty effect. They may also be used for edgings of stages in warm greenhouses by planting out the second season, and they bloom profusely. I should point out that mealy-bug is very fond of the plants, so that they should never be placed in houses where this pest abounds. Thrips are more readily kept down, and if the plants are grown in a greenhouse, they are less troubled with insects, so that after the first shift, they may be given a cool frame or moist green-house, in which situations they will produce strong leaves and abundance of bloom. *G. Wythes.*

MARRAM GRASS.

Baron Sir Ferd. von Mueller contributes the following letter relating to the Marram-grass (Ammophila arenaria), the value of which for planting on loose sandy sea-coasts is so very great:—"I can inform you that cattle in this district will eat the Marram-grass, no matter how coarse it may have grown, and it is undoubtedly a good fodder for cattle during our winter. I do not attempt for one moment to say that I would plant Marram-grass for fodder on land that would grow Rye-grass, Lucerne, Clover, &c., but I do certainly say that if any person has got any sandy land which is of a shifting nature, and on which they can get nothing to grow, I would advise them to plant that grass, and they would soon have the land covered with vegetation, which would prevent the sand from drifting, and be feed for cattle, and the more the grass is dug out, burnt, or eaten off, the better it improves; it grows richer, and not near so coarse, and, once the land is properly stayed (if required) different kinds of grasses could be sown amongst the Marram-grass. As a sand-stay, there is nothing to equal it. It does not matter how high the sand-hill may be, or how great the drift, if the grass is properly planted, it is an easy matter to get it to grow, and also to prevent the sand drifting. I may inform you that the Borough Council of Port Fairy were desirous of making a road to the beach from one of the streets of the town, and to do so they had to cut through a hill of drifting beach-sand. Many persons at the time prophesied that it would be impossible to prevent the sand from drifting; however, the work was undertaken, and a cutting of about 25 feet width was made through the sand-hill, and the Marram-grass planted to prevent drift, with the result that no sand whatever drifted into the cutting, and the whole place is now covered with grass. While in Adelaide, some few weeks ago, I took a run down to Henley Beach and the Grange, where I noticed that the sand along that coast in places was drifting very badly; if steps were taken at once to plant the drifts with Marram-grass, it would prevent a lot of valuable property from being destroyed, and the cost would not be very great. *Samuel T. Avery, Port Fairy.* [For illustration, &c., see *ante*, pp. 745, 750, December 16, 1893.]

A TRAVELLER'S NOTES.

(*Continued from p.* 469.)

A bush-house, eight glass-houses, and various pits are situated in the old garden. The first, with ends and sides of open trestle-work, has a broad arched roof of dried twigs of Leptospermum scoparium. Tree Ferns and Palms occupy the main portion. Alsophila Cooperi, of which there are several good pieces, on stems 20 to 25 feet in height, is exceedingly pretty; Cyathea Cunninghami, C. Brownii, Dicksonia squarrosa, Cocos, Kentias, Latanias, &c., are all in good condition.

Of the eight houses, five are to a great extent devoted to propagating purposes, and three reserved as show-houses. The latter are as smart and neat as one can well wish to see. Two are devoted to a general stove collection, and one to Orchids, in very good condition. Calanthe Veitchii and C. vestita, Dendrobium Phalænopsis, Cattleya Bowringiana, Zygopetalum Mackayi, Cattleya Eldorado, Cypripedium Sedeni, C. Harrisianum, C. longifolium, Pholidota imbricata, are all in flower; Cœlogyne speciosa, one piece, has eight open blooms. Dendrobium undulatum is showing three spikes, and Angræcum eburneum a good strong one. The collection of Stanhopeas is good; Rhynchostylis retusa, large pieces of R. cœlestis, Brassia maculata, several Oncidiums, and Platyclinis are all doing well. The contents of the Orchid-house of the Sydney Botanic Gardens are in good condition, and one of the best collections in Australia.

The two stoves are in no way behind. In one, the stages are low, scarcely 30 inches above the ground; arranged in this manner, the plants are seen to greater advantage. The walks are channelled for the purpose of evaporation.

Amongst the best specimens of Palms are Hyophorbe Verschaffeltii, Areca rubra, Dæmonorops pericanthus, D. fissus, a most graceful thing; Carludovica palmata, small palmate leaves on erect 6 to 7 feet stalks; Verschaffeltia splendida, very fine, its leaves 10 to 11 feet in length, certainly one of the handsomest Palms grown; Caryota sobolifera, Chamædorea Ernesti Augusti, &c. In one house, from the roof, hung a Nepenthes Rafflesiana, with pitchers of maximum size, and N. Veillardii, a curious species from New Caledonia. The stove plants are in excellent condition and perfect health.

The Lower Garden, the greater part of which was reclaimed from Farm Cove, an inlet of Port Jackson, would probably appeal to the general public as the prettiest portion of the whole. Divided from the old garden by a wall (shortly to be removed), a broad border runs along its length at the highest limit. Here Ficus Parcelli, 15 feet high, is as striking a variegated bush as could well be imagined, the numerous fruit flushed with red in no little degree contributing to the effect. Daphniphyllum glaucescens in perfect condition, assumes even greater dimensions. The large metallic leaves of Ficus Bennetti from the South Sea Islands, produced in profusion on a tree 30 feet high, and covering a space, the diameter of which is as great, form an imposing mass. Behind is a noble New South Wales Flame-tree, the largest I have met; it must offer a gorgeous spectacle when in flower!

Theophrasta imperialis, Bocconia frutescens, Alstonia constricta, the Bitter Bark, the fine foliaged Macadamia tenuifolia, and Musa sapientum fruiting freely, do well in this border; but possibly the most interesting is a huge Platycerium alcicorne on an old tree stem. Being 10 feet in diameter, this mass of fronds is a remarkable sight.

Immediately in front of the refreshment kiosk is one of the ponds, dependent for its water on the creek running through the garden, the banks of which in parts are lined with Tree Ferns.

Weeping Willows, and dwarf stumps of Todea barbara line the slopes of the pond, one side being a perfectly solid bank of Canna indica.

On the island in the centre are various plants of Seaforthia elegans, and a Livistona australis, on stems 35 to 40 feet in height, and several fine trees of Alsophila Cooperi and A. australis with an undergrowth of Cannas, Caladium esculentum, &c.

Buried in the end of a clump of Cyperus antiquorum is a plain stone obelisk "To the memory of Allan Cunningham."

To the left of this pond is a section devoted to Monocotyledonous plants, each of the variously shaped beds containing a natural order represented by the most diverse genera available.

In the borders close by, Solandra lævis is in flower, with its long cup-shaped yellowish blossoms. Michelia Champaca has grown to 40 feet in height, and Panax incisa, with immense rich glossy pinnate leaves, Simaruba grandis from tropical America, Erythroxylon macrohyllum, Plumiera acuminata, Eugenia grandis, a fine shrub, 25 feet in height; and the Queensland Tristania conferta, over 60 feet, are all worthy of mention.

On a lawn behind the tongue leading to the west gate are many Conifers, some thoroughly at home. The tall symmetrical Cupressus Benthamii from Guatemala, Pinus longifolia, P. canariensis over 50 feet, P. Pinea over 60 feet, Pinus Laricio, P. Massoniana. Cupressus thyoides variegata 25 feet, C. lusitanica, &c., all do well. The finest Fig in the garden, a Ficus rubiginosa, a truly magnificent specimen, is but a few yards from that portion devoted to Dicotyledonous plants, and there is also a small collection of those medicinally valuable.

Several Jubæa spectabilis, Thuia orientalis, Ficus Harlandii from Hong-Kong, its old and young wood studded with myriads of fruit; Magnolia grandiflora 25 feet high, a seedling Kentia Fosteriana, but little less, situated near a clump of Bambusa plumosa, Juniperus chinensis, and Ptychosperma Alexandræ, slight and graceful as in its Queensland home, are amongst the specimens and general borders of the western side.

The largest lake is about the centre, and well stocked with swan and duck. Willows, shortly to assume their winter garb, do well on its banks and islands, the latter having some good Livistonas, Musas,

and Chamærops, &c. Following the eastern tongue of the cove, various mixed shrubberies are met with, whilst amongst the single specimens are Ficus Bellengerii, with peculiar oblong fruit, Eugenia achimenoides, with pretty young growth; Ficus macrophylla, with a low flat head, probably owing to the silt it is planted in; and Citharexylum subserratum, with numerous narrow long spikes of white flowers.

Mexican plants are well represented, the foliage of Fourcroya Lindeni is particularly massive, and that of Agave Milleri 12 to 14 inches across. Near a good Quercus virens on the slope are Ilex latifolia, Arbutus canariensis, Photinia serrulata, Bauhinia purpurea, Ficus Benjamina, a weeping species, and Hedera terebinthacea from Ceylon. Sterculia rupestris, the Queensland Bottle-tree, has a diameter at its broadest part of 3 feet, and Quercus Cerris reaches 50 feet.

One bed is devoted entirely to Agaves, and another to Macrozamias—M. Moorei being at the moment the most striking of all.

From Adelaide to Sydney many old residents agree that the climate of the last few years is markedly different to that experienced previously. The terrible hot north winds are less fierce and less common; one explanation offered being they blow over cultivated land instead of sandy waste or scrub. In N. S. W. and Victoria droughts have been less severe, and this season in particular a specially heavy rainfall is recorded. An increasing mildness of climate has undoubtedly prevailed for several years—the natural question is—will it be permanent? *James H. Veitch.*

(To be continued.)

GREENHOUSE HARD-WOODED PLANTS.

(Continued from p. 118.)

Statices.—Strictly speaking, the greenhouse Statice may not be a hard-wooded plant, but it is sufficiently so to claim notice under this head. The true value of the Statice as a decorative plant is not nearly enough known or appreciated in private gardens; on the other hand, as a market plant, it is not perhaps sufficiently showy to attract those who attend alone to this particular feature. As a greenhouse or conservatory plant, however, the Statice in its best known varieties should be grown far more than it is at the present day. Those who have to provide a large number of decorative plants will find n the genus in question a true friend from early in May until September. A dozen or so, for instance, of Statice profusa would do as much service as twice or thrice the number of other and commoner plants. True, the colour in each variety is very nearly the same, yet we have not any too many flowering plants in which blue prevails; the actual flowers themselves are white, but these do not last any great length of time, yet they are rapidly succeeded by others until each spike is exhausted. The calyx of each individual flower will last in good condition for a considerable length of time, provided the treatment be in accord with the keeping of the same; a damp atmosphere or the use of the syringe overhead, be it noted, will soon cause the blue or bluish-purple to vanish. When grown in a well-ventilated house each spike is a most pleasing feature, the pure white flowers affording a delightful contrast to the calyces.

Culture.—Under no circumstances can Statices be considered difficult plants to manage, except in so far as all plants that are subjected to attacks from insect pests come under that category. They are essentially free-growing plants, being easily managed by all who have a greenhouse at their disposal. I have myself grown and exhibited them from a cool vinery, but I should prefer the greenhouse. Starting with young plants in the early spring, it is possible to have them of good size by the autumn. As soon as growth becomes active early in the year, it may still further be encouraged by keeping the plants in a moist atmosphere; a Peach-house, for instance, would suit them for a month or six weeks, then the ordinary temperature of the greenhouse will suffice. If the plants are not wanted to flower very early, the first spikes may be pinched out—this will give two in the place of each one later on. Potting I much prefer to perform in the spring, when the roots commence to be active. In doing this, avoid by all means the evil of over-potting; it may incite the growth for a time, but the day of reckoning will as surely follow. The roots of the Statice are minute, produced in profusion, but tender; hence very susceptible to sour soil, which will ensue after over-potting. The soil best suited to their culture is fibrous yellow loam and good lasting peat; two-thirds of the former to one of the latter with silver sand in plenty. Should the peat be at all indifferent, use good leaf soil in its stead; in fact, it is almost a matter of choice between the one and the other, provided the other essential of firm potting be attended to in a proper manner. If a plant be somewhat unhealthy at the roots, a reduction of the ball and a close treatment afterwards will be a beneficial to it. When well established and the plants taking water freely, with spikes of bloom opening, I have found a weak solution of Peruvian guano in water to be a good stimulant. Any other manure would do that is not highly concentrated, and with a tendency to burn (so to speak) the roots. In no case should dependence be placed upon strong or repeated doses of any manure, as the results may be contrary to the expectations. As the plants go out of flower, less water should be given; sufficient only to keep them from flagging. This will carry them safely through the winter season, but during growth a more generous treatment in this respect is most advisable. Propagation is easily accomplished in the spring in moderate heat, each cutting being placed singly in a small pot, using as soil nearly half sand and the rest loam.

Of insect pests I have found the black thrip to be the most troublesome, and if not closely watched it will soon injure the foliage. Dipping is more effective than fumigation, as this insect is not so easily reached by the latter process, being located in most cases upon the under surface of the leaves. Mealy bug is a great annoyance, and it is only by the closest attention that it can be eradicated, for in the use of strong insecticides there is the risk of injury to the foliage. Other insects will rarely cause any serious trouble.

Varieties.—The varieties of the Statice as now grown in the greenhouse are not numerous, three only calling for any special comment. I note, however, on reference to the catalogue of a well-known firm (date 1871), that eight kinds are enumerated. Statice profusa (already alluded to) is no doubt the best all-round variety to grow by reason of its dwarf and compact habit, and the profusion of its spikes during a long-continued season. It is useful as a small plant in a 48-sized or larger pot; in a 32-pot a really good plant can be grown. Statice Butcheri is a variety of S. imbricata, but much superior to it in colour; beside the former the latter is of quite a pale shade when in bloom, and not nearly so effective. A well-managed plant of S. Butcheri has the deepest coloured flowers (i.e., calyces) of any. Along the south coast it is nearly always a fine feature at the summer shows. To manage it well, so as to produce a fine mass of flower, the spikes, as they attain to about half their full length, should be pulled down gradually to a horizontal position; this will cause lateral shoots to issue from buds on the spikes which would otherwise remain either quite dormant, or at the most, be but weakly offshoots from the main spike. S. Holfordi, which I would quote as the third variety, is reputedly a garden-form of S. macrophylla; from the size of its foliage, I do not think there can be much doubt on this point. When well-grown it is a noble-looking plant, both as regards foliage and flower, its spikes are very robust; its leaves glabrous and almost entire, whilst those of S. Butcheri are deeply lobed and downy. S. Holfordi with its tall spikes makes a fine plant for the greenhouse or conservatory during the summer.

Of S. imbricata, Messrs. C. Lee & Sons possess an excellent variety of dwarf and profuse-flowering character. The name under which it is known is Statice floribunda, a First-class Certificate having been awarded it by the Royal Horticultural Society on May 23, 1883.

Witsenia corymbosa.

No one who takes an interest in, and has room to cultivate a general mixed collection of greenhouse plants, should lose sight of this singularly interesting plant. When in flower, scarcely anyone could fail to be struck with its beauty, the bright mazarine blue of the blossoms being so very distinct. It has not the reputation of being free-flowering, but it is easily grown. To remedy the defect just alluded to, I would endeavour to overcome it by keeping the plant as dry through the winter as is consistent with safety, almost in the same way as with Agapanthus umbellatus. Then by giving a decidedly different treatment from the spring onwards, I am persuaded that the results would be satisfactory. It is an ally of the Iris, a distant one, it is true, but in the disposal of its small leaves this can be detected, although, unlike the Iris, it forms a hard-wooded stem. It is a peat-loving plant, and whilst growing should be watered freely, a cool but moist atmosphere being likewise congenial to it. Only one species is known to exist, and this was introduced as far back as 1803. *J. Hudson.*

(To be continued).

BLICKLING HALL.

[See Supplementary Illustration.]

Blickling Hall is one of those mansions in which the eastern counties abound, and which has the element of age to add to its other fascinations to the visitor, be he interested in arboriculture, horticulture, or antiquities. It is only comparatively old, and is in a state of excellent preservation, a substantial sort of link with bygone times, connecting those of the early Stuart with our own. The mansion, a large quadrangular structure, built in the form of the letter H, has two open courts in the centre, with turrets at the angles, and a clock tower over the entrance, and it is built of brick with stone quoins and window openings.

The surrounding park has an area of 700 acres, well-stocked with deer; and about 200 yards distant from the house is seen a portion of the large lake of about 90 acres, one of the finest pieces of artificial water in the kingdom. This extends in crescent form for about a mile, with a width, where broadest, of 400 yards, and it is skirted by park-land and well-wooded gentle acclivities, which afford a very pleasing bit of landscape.

It may be interesting to note that the manor of Blickling was held by Harold, and after his defeat at Hastings, the Conqueror settled the entire manor and advowson on the See of Thetford, afterwards on the foundation of Norwich Cathedral—an instance of the manner of dealing with vested interests in the 11th century.

In 1413, Blickling became the property of Sir Thomas Erpingham; and having passed through several hands, it came into the possession of Sir Thomas Boleyn, the father of the unfortunate Anne Boleyn. From the Boleyns the manor passed to Sir Robert Clere, on his marriage with Alice Boleyn; and then to the Hobarts, ancestors of the Earl of Buckingham. The old mansion was pulled down by Sir John Hobart, and the present house built, it being finished in 1628. The second Earl rebuilt the west front in 1769. Money could not have been very plentiful in the family at that period, for we find the countess bequeathing her jewels towards defraying the expenses. The present possessor is the kindly and popular Constance, Marchioness of Lothian, who throws the place open to visitors every Tuesday—a rule, we were given to understand, not very rigidly adhered to.

Our illustration shows the present flower-garden, which is adjacent to the mansion, occupying a sheltered level nook of about 1½ acre, which has been cut out of the land which sloped somewhat steeply upwards at that part, the rising ground itself beyond being dealt with in a bold and effective manner by constructing a central gravelled path of considerable breadth, so as not to run into insignificant narrowness at the end farthest from the

beholder. This path, bordered on either hand with turf, and shrubberies planted with Evergreens, is furnished with occasional flights of steps in its course, so as to modify the steepness of the ascent, and afford considerable stretches of nearly level walking. The soil excavated from the site of the flower-garden was used in filling in the end of the lake nearest the mansion. This flower-garden last summer was a very charming example of the modern style of filling the beds, and we have little hesitation in saying that it is one of the best existing in which tender exotic plants are almost banished by hardy herbaceous perennials.

The present head gardener, Mr. Oclee, who has made most of the present gardens during the past twenty-five years, has entirely mastered this new, or shall we not say, revived old style of planting a flower garden, which while it is never ablaze with masses of colour gaudy or otherwise, is at all times well-furnished with flowers, and therefore an object of just admiration. The form is an equal-sided parallelogram, and its general surface contour is effectively broken up by low standards of Acer Negundo foliis variegatis, beneath which was planted Lobelia cardinalis variety Firefly, a very glowing and vigorous growing plant. These standards being irremovable, afford something to look at in the spring and early summer arrangement, and being made amenable to somewhat close pruning, would be very pretty objects when coming into leaf. Other objects to break up the surface and afford variety are Junipers and Thuias, the latter being kept squat and low, and the former allowed to keep their columnar habit.

The beds are of simple form, as best befits their occupants, and the beautiful old turf as soft as velvet, such as one always finds about these old country seats, out of which the design is cut, is of that sufficient width between the beds to prevent any appearance of crowding, and yet not to err on the side of too great looseness. There is no point, not even from the adjacent high ground, whence the whole design can be seen; there is, therefore, the charm of there being something worth seeing beyond, that is always necessarily absent in flower gardens consisting of a number of beds filled with dwarf plants, where you get no surprises. We may specify a few of the kinds of plants employed—Dahlias of all sections, Zinnia Haageana, a good orange-coloured variety, more trustworthy than any Calceolaria for bedding; and of similar usefulness a buff-coloured variety of tuberous-rooted Begonia, a plant Mr. Oclee is fond of. It is well adapted for good-sized beds, and is of more than ordinary good quality as a flower. Salpiglossis in variety, Tagetes patula or pumila, a most useful plant, and very showy in masses, clumps, or lines. Coreopsis in variety, Carnations, Cannas, Helianthus of tall and dwarfish varieties, both single and double flowered; Gladiolus Brenchleyensis and G. Gandavensis; Phlox decussata in great numbers, both tall and short; Hollyhocks, Marguerites, Michaelmas Daisies for late flowering, Chilian Beet, Monarda didyma, and much more of the same kind of material. Pelargoniums were remarkable for their almost complete absence.

This garden is kept presentable the whole course of the year, and so soon as the summer occupants are considered to be no longer sightly, their places are taken by Evergreen shrubs and the usual kinds of spring and early summer-flowering plants, including bulbs of all kinds, these again making room for the summer flowers.

The woodland walks and pleasure-grounds at Blickling are well worth a visit, and many interesting views of the interior of the place and the surrounding landscape are obtained in the course of a walk round. Much fine timber is found about the grounds, and rare species of trees are not uncommon.

Two immense specimens of Platanus orientalis stand together, yet with space for the fullest development, whose branches, some 16 to 20 yards in length, have reached the turf and there taken root all round these trees, some of them being rooted in two and three different places.

The kitchen garden, admirably kept, revealed fine crops of Pears on the walls, the fruits of Beurré Diel and Glout Morceau being of rare size. Apples and Pears are grown on walls that were once planted with Peach trees, these latter never being a success in northern Norfolk if placed on walls facing east, the brine-laden winds soon causing a blighted and unhealthy appearance.

The Vines are well done, and excellent crops of Gros Colmar, Black Alicante, Muscat of Alexandria, and Madresfield Court as a back-wall Vine, were remarked.

The peacheries contained many fine fruits of Princess of Wales and Prince of Wales Peaches, and in the earlier ones the trees were large and healthy. In a plant stove Bougainvillea glabra was finely in flower, and Cheilanthes Mooreana had grown into an enormous specimen. This most interesting old place is reached by railway to Aylsham, from which it is distant about 1½ mile.

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By J. F. MCLEOD, *Gardener, Dover House, Roehampton, S.W.*

MISCELLANEOUS OPERATIONS.—Except in very favoured parts of the country, flowers out-of-doors fit for cutting are over, and those under glass will for the future be used instead. Amongst these at the present time the Chrysanthemums stand first, possessing as they do such varied colours as to well fit them for filling vases, &c. Care should, however, be taken that the blooms are fully developed before cutting them, or they will be lacking in character. Where these plants are extensively grown it is usual for the gardener to arrange one or more groups in the greenhouse, when, if the colours are well chosen, they have a very good effect. In arranging such groups the blooms should stand well apart, so that the handling of them may be done without inconvenience, it being essential that they should be frequently examined, and all the decayed florets, as fast as they appear, removed. The varieties, Edouard Audiguier, Viviand Morel, F. A. Davis, &c., are more subject to damping than some others, and should be kept in the warmest part in the greenhouse, with a free current of air passing amongst them. It would not be easy to fix the exact temperatures in which the plants should be kept at this season, as so much will depend on the manner in which they have been cultivated, the purposes for which the plants are grown, the stage of bud development, and the position of the structure in which they are located, and the outside temperature.

BOUVARDIAS.—These plants, if flowering freely, should be kept somewhat close; with a night temperature of 55°, while with sun-heat 10° more may be afforded. Continue the use of manures, regulating the strength of the doses according to the state of the root-growth.

CYCLAMENS.—The earliest batch of these plants now coming on to flower should be stood close to the glass, allowing a current of air to pass under the foliage, moderately cool treatment being aimed at; but a slight degree of heat in the hot-water pipes with ventilation will be found to answer well. Water at the root must now be carefully afforded, the plants at this stage being easily spoiled if too much water be supplied. When any flower is removed, it should be pulled clean away from the crown of the corm, as if cut off with a knife the remaining portion damps off, and there is the danger of decay being set up in the corm. Later lots should be kept freely ventilated in light houses. Salvias, Eupatoriums, Lantanas, &c., will now be supplying a large proportion of the cut flowers, and will require liberal supplies of farmyard manure, with a pinch of soot added to it, which will assist in the production of finer flowers, as well as in prolonging the flowering of the plants. A temperature of 50° by night, with a rise of 10° by day, will suit them if air in moderation be admitted if the structure is a light one, otherwise air in considerable amount should be admitted. Solanums, being less fruitful this season, owing to lack of sunlight, should be more than usually well-ventilated and kept near the glass, by which means a freer setting of the berries will be encouraged.

LASIANDRA (PLEROMA) MACRANTHA.—The flower-buds having now formed, manure water may be resorted to, to plump them up; a slightly warmer temperature maintained, and the house kept rather dry.

CELOSIAS.—The latest batch will now be coming into flower, and should be stood in the plant-stove, water being very sparingly afforded. A suitable size of flower-pot for Celosias at this season is a 48.

THE HARDY FRUIT GARDEN.

By T. TURTON, *Gardener, Maiden Erlegh, Reading.*

PRUNING OF WALL TREES.—In view of the shorter working day, and the various hindrances to the carrying out of various operations in the fruit garden which occur in the winter season, every opportunity should be seized upon to forward them. Pears and Plums, if aged, require much reduction in the number and length of the fruit-spurs. In dealing with such trees, it is best to saw off the longest of these to about 2 inches of their base, these saw-wounds being made smooth with the knife. It is a practice which, if carried out every year, tends to keep the trees furnished with fruit-spurs of moderate length, and renders the pruning, nailing, and cleaning of the trees easy matters; moreover, the fruit is exposed to the light far more than is the case of trees with a great number of long bearing spurs. Pruning at this season favours the production of new shoots from dormant eyes, which is not the case with late pruning. Any further pruning of Pear and Plum-trees on the walls will consist in the removal of the later growths on foreright shoots, and shortening of the leading shoots, more or less, in accordance with the amount of space which has to be furnished. Any trees of great vigour may have the leading shoots of the main branches cut back to 2 feet from the point whence they started, which will secure a good break along its entire length. Young trees which have been replanted as a check to strong growing may be left unpruned till the spring, a time when the trees having begun to make roots anew, the cut-back shoots will break readily.

INSECTICIDES.—Trees of the Pear that are infested with scale are not easily ridded of these insects, and the first step should be to loosen the trees from the wall, and with Fir-tree oil, or other insecticide, of twice the strength recommended for aphis, scrub every part with a half-worn-out paint-brush, being careful to get at the back of the branches. Apart from the injury the Pear-tree scale causes, it gets on to the fruit, whence it is not easily removed. Any Plum tree infested with brown-scale should be treated in a similar manner, but if black-aphis only be troublesome, the trees may be well syringed with strong soap-suds, to every 3 galls. of which 1 gill of petroleum has been added, keeping it well stirred up whilst being applied to the tree.

THE STRAWBERRY.—All beds of these fruits, excepting the newly-planted ones, should be drenched with liquid-manure, which, after the recent rains, will be easily obtainable in most gardens. As previously pointed out, this practice is more to be recommended than the commoner one of a heavy dressing of manure, which provides a shelter for the slugs, and hinders the aëration of the soil and the sweetening effects of frost upon it.

ARREARS OF WORK.—Any root-pruning, lifting, and replanting of Apricot, Peach, and Nectarine trees or any other operations advised in recent calendars, should now be completed; bearing in mind that the early replanting of trees on the Plum stock leads to no loss of crop the next year.

THE KITCHEN GARDEN.

By ARTHUR COOMBES, *Gardener, Himley Hall, Dudley.*

FRENCH BEANS.—Those growing in pots should be placed where they get full sunlight, preferably in a heated pit. Let the temperature range from 60° by night, to 70° and 75° by day. It gives less trouble to cultivate French Beans on beds of soil in such hotwater-pits than to grow them in pots. The soil should be light and rich, and the Beans planted in rows at 1 foot apart, thinning out the weaker plants, so as to leave those that are to stand for a crop at 8 inches apart. Afford no water till the plants are in true leaf, and then at a not lower temperature than that of the pit. Syringe the plants on fine days except when in flower, at which time, and in cloudy, dull weather, a morning dewing over will suffice. If a proper place be not at command, the forcing of French Beans had better be postponed till mid-winter is past.

CAULIFLOWERS.—A watchful eye should be kept upon those plants now turning-in, breaking a few of the heart-leaves over the curd to prevent injury by frost and rain. Those having usable heads should be lifted with a ball of soil, and stood thickly together in a deep frame or some temporary kind of pit.

BROCCOLI.—Where these have been planted upon firm and not over-rich ground, and sufficient space allowed them, the plants will be sturdy and not so liable therefore to injury by frost; but if they are drawn, or coarse have a leaf-growth due to close planting, or a rich soil, heeling the plants over will be advisable. It is not so injurious as replanting them. Take out a spadeful of mould on the north side of each plant and press it over in that direction with as little disturbance of the roots as possible, placing the spadeful of soil on the south side, and making it firm with a tread of the foot.

MUSHROOM HOUSE.—More artificial warmth may be now required in this place, although if many beds are in various stages, the warmth they give off will be considerable, and consequently fire-heat needs to be cautiously used; a temperature of 60° should not be exceeded. Under 60° growth is slow, but when above this figure, the beds soon exhaust themselves, and the produce is thin and poor in quality. Collect material and make new beds; and should the warmth of a bed decline quickly after spawning, cover it over with fresh straw or litter, which will cause the temperature to rise somewhat, and thus save the crop.

THE ORCHID HOUSES.

By W. H. White, *Orchid Grower, Burford, Dorking.*

TERETE-LEAVED ORCHIDS.—In almost every general collection of Orchids, some of the following terete-leaved species are included. Many of them are beautiful, some singular, and by no means unattractive. Scuticaria Steelei requires an East India-house temperature, and should be suspended well up to the roof-glass in the lightest position. A less showy species is S. Hadwenii, but which nevertheless is well worthy of cultivation; it should be grown in the intermediate-house, and well exposed to the light at all times. Both plants may be either attached to flat blocks of Teak-wood, with a little sphagnum about the roots, or be placed in shallow baskets. The success in cultivating them depends more on the temperature and atmosphere of the house than on anything else. When in full growth they should be freely syringed, but during the resting season they will need to be dried, though it must not be carried so far as to cause the foliage to shrivel. Angræcum Scottianum is quite a little gem; it succeeds admirably when grown in a hot sunny corner of the East Indian division, and if well syringed overhead several times a day during active growth, it will thrive and bloom profusely. At this season a good watering both morning and afternoon will be sufficient. The best and most natural method by which to grow them is to train their slender stems, which are of semi-scandent habit, around Teak cylinders. It is very important to keep the stems upright, and to tie them firmly to the bars, so that the small roots immediately they commence to grow may have something substantial to cling to. When the plants have overgrown the length of the Teak bars, another cylinder should be screwed on to the top of the old one, thus avoiding any disturbance of the roots, which, if once detached from the material they are clinging to, rarely, if ever, make further progress. During the flowering period the syringing overhead must be discontinued, but the stems and roots may be kept moist by pouring water over them from a watering-can. The beautiful white-flowered Aërides vandarum requires similar treatment in all particulars, but to induce it to flower freely it should be well exposed to the sunlight during the autumn months. If, however, cultivators find any difficulty with this plant in the warm-house, they should remove it to the Mexican-house, where it may succeed better. There are also two Brassavolas, B. Perrinii and B. stricta, which have terete, pendulous leaves, and, like the preceding species, they do well in a high temperature, succeeding best on Teak rafts suspended near to the roof. During their period of rest they only require water at the root on bright sunny days; at other times the moist atmosphere in the house is sufficient to keep the pseudobulbs plump. Oncidium Sprucei, O. rotundifolium, and O. juncifolium have similar leaf characteristics, but are erect in their habit of growth. These do well in pots or small hanging pans, in peat and moss in equal proportions. During growth, copious supplies of water are necessary, but the most critical time is on its completion, when, if kept too wet or too dry, the leaves may spot or fall prematurely. Put them in the hottest house available. Of the terete-leaved section of Oncidium, O. Jonesianum is undoubtedly the most handsome, but unfortunately it is a plant difficult to preserve in a satisfactory condition. For a year or two it grows fairly well; even then, under the best cultural conditions, the leaves rarely attain the size of those imported, and after producing a strong inflorescence, they generally show signs of exhaustion. So far as my experience goes, attachment to blocks is the most suitable, and the temperature of the Cattleya or Mexican-house. Suspend the plants close to the glass, and where they may be but thinly shaded; afford abundance of water during growth, and when completed, fully expose to direct sunlight, and do not allow the leaves to shrivel. Those who possess plants of this species would do well not to allow the flower-spikes to remain on the plants for too long a time. Vanda teres and V. Hookeriana were treated upon in a former Calendar; and it is only necessary to caution inexperienced growers against over-resting the plants. Here they are never subjected to any severe drying, and under such treatment each stem produces strong spikes, with from four to nine flowers of large size and substance. Luisia Amesiana, L. volucris, L. zylanica, and L. Psyche are all very similar in habit of growth to Vanda teres, and, like that species, they require much light, and when growing, much water. Tetramicra bicolor, better known as Leptotes, a dwarf-growing species, with short terete leaves, may be grown on blocks of wood, with a little sphagnum about the roots, or in small shallow pans, with fibrous peat and broken potsherds intermixed; and they prefer a light airy position near the roof of the intermediate-house. Water should be afforded at all seasons whenever the compost has become dry.

FRUITS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

VINES.—The pruning of Vines may now be taken in hand as soon as they are relieved of their fruit and the leaves begin to fall, there being no necessity to wait till every leaf has fallen. There are different opinions as to the best kind of instrument for the work; with me for many years past the short pruning scissors (*sécateur*), 6 inches long, have taken the place of the pruning-knife. They are very strong, make clean cuts, and are handier than the knife. Many of us remember the old apprentice days, when one of us had to sharpen the knives, and the other hold the Vine-rod for the master to cut. Any Vines that were planted last spring, and which have not grown strong enough to be fruited, or that are not required to fruit next season, should, if they are intended for single rod Vines, be cut down as far as the bottom of the vinery rafter; and those for double rods should be cut back to a point 15 inches lower than this, so as to give space for training the shoots into the best position. It is better to carry out one uniform system for each house of Vines, either of single rods or double rods, as it looks neater, especially when a new range is planted. Extra Vines planted between the permanent ones for fruiting next season, if strong and well-ripened, should be cut down to about 9 feet, or to a good strong part of the cane, when it is strong enough to carry fruit; and young permanent Vines strong enough to be allowed to fruit next season should not be left too long for the first season, but should be cut back to about one-third the length of the rafter, for if left of greater length the lower part of the cane will perhaps break weakly, and the permanent spurs for future fruit-bearing not be satisfactory. Two-year-old Vines should be pruned well-in on the close spur system, leaving one bud close to the main stem; and the leader must be pruned back in proportion to its strength and fitness for bearing and forming spurs. As a remedy against bleeding after the pruning, use painter's knotting or styptic. The spur system is the best for young Vines for some years, but when signs of weakness or exhaustion from hard forcing or severe cropping are visible they can soon be brought round by allowing new rods to be taken up, the extension in this way causing new roots to push forth at the same time. Early forced Vines after a few years often require to be thus extended. Young rods on old Vines are very accommodating, they may be carried in any direction and yet ripen well. Old Vines should always be pruned as soon as possible at this season, affording them abundance of air afterwards; and the spurs should be thinned out to 12 or 15 inches apart, overcrowding in any form being carefully avoided. The bundle-of-rods system, about the worst that can be adopted, should be avoided; about 4 feet is the least distance at which each rod should stand apart, and then they obtain all the light and air that is required.

THE FLOWER GARDEN.

By John Lambert, *Gardener, Powis Castle, Welshpool.*

HARDY DECIDUOUS FLOWERING TREES AND SHRUBS.—Where alterations in or the making of shrubberies are contemplated, it will be necessary first of all to put the ground in good order for the various trees, shrubs, &c., by deep digging, manuring, and the incorporation of peat and loam, according to the needs of the various kinds of plants. Wet land should be drained with rubble drains, 3½ to 5 feet deep, draining into a dry well or other outlet. Such drains should not be more than 20 feet apart and ought to run in the direction of the fall of the land if it have any, or be made with an artificial fall to the main drain. When planting commences, that is, after the dug land has had time to settle somewhat, and is not sticky on the surface, each plant, after it is properly set in a hole and the roots spread out, should have these slightly covered with the soil, and then some manure; covering this with more soil, treading all moderately firm before quite filling-in the hole. The proximity of the manure to the roots causes them to tend upwards rather than downwards in search of nutriment, and progress is quickened thereby. Towards the end of this month, Lilacs, Viburnums, Philadelphus, Forsythias, Spiræas, Daphnes, Azalea mollis, A. pontica, Privets, &c., also those usually classed as trees, viz., Cerasus in variety, Prunus, Cratægus, Mespilus, and Acacias may be planted. In planting shrubs, allow them sufficient space to grow into characteristic specimens, and show themselves to the greatest advantage. When forming new beds of shrubs, the position which the permanent specimens will occupy should be indicated with stakes and labels, planting them first; the filling in with others being done for the sake of appearance. These latter in most cases will be subsequently cut out or transplanted as soon as the least crowding is apparent. It is seldom that this timely removal of superfluous plants is well done, and the resulting state of things leads to shifting and transplanting every year which are a great waste of money and effort, and often leading to the retention of the wrong shrubs. Shrubs which flower on the wood of the previous year should not be pruned now as a general rule, although shoots which are weak and presumably flowerless, and the weak shoots of the interior of the bush, may be cut out. Young shrubs which it is desired to render more bushy may have the strong shoots cut back, and the weak ones removed entirely. Spring and summer-flowering shrubs of this kind should receive their pruning when flowering is over. Those shrubs that flower on the young wood may be pruned at this season. No shrub which is to be or has been transplanted this year should be pruned.

FLOWER-BEDS AND BORDERS.—The recent frost experienced generally over the country (here we had 11° on Oct. 21) will have disfigured all tender bedding plants, and these should be cleared off the beds as quickly as possible. The tuberous-rooted Begonias should receive attention first, carefully removing the tubers according to the colours of the flowers, and labelling them forthwith—a matter that is soon effected. Do not clean the bulbs of all the soil that hangs to them, but leave a thin coating, letting this dry gradually in some airy shed or house for a time; then rub off the rough parts, and store them in boxes in sand, or place on shelves where they will be safe from frost and damp. Gladiolus will require similar treatment, but these will need to be well ripened up and cleaned, the bulbils being removed, storing them all away in paper bags till again required.

ECHEVERIAS AND SEMPERVIVUMS.—Store these plants in sand or dry soil. Nooks or odd corners may often be found for these, and if well exposed to the light, a slight frost will not injure E. secunda glauca. If places of this kind cannot be found for these plants, stack them in sand or soil in an almost upright position by the side of a warm wall, where the eaves will assist in sheltering them from the rain and snow, and a slight covering protect them from severe weather; the chief point being to keep the soil in which they are planted as dry as possible.

Local News.—*Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

TUESDAY, Nov. 6 — National Chrysanthemum, at the Royal Aquarium, Westminster (three days). Chrysanthemum Shows will also be opened at Brighton (two days), Leeds (two days), Croydon (two days), Watford (two days), and Devizes (two days).

WEDNESDAY, Nov. 7 — Chrysanthemum Shows at Bournemouth (two days), Wolverhampton (two days), Torquay (two days), Bath (two days), Hereford (two days), Ware, Doncaster (two days), Ascot (two days), and Newbury.

FRIDAY, Nov. 9 — Devon and Exeter Gardeners' Association Chrysanthemum. Hitchin Chrysanthemum and Horticultural.

SALES.

MONDAY, Nov. 5 — Dutch Bulbs, at Protheroe & Morris' Rooms. Roses and Hardy Plants and Bulbs, at Protheroe and Morris' Rooms.

TUESDAY, Nov. 6 — Important Annual Sale of an enormous quantity of Nursery Stock, at the Hale Farm Nurseries, Tottenham, by order of Mr. T. S. Ware, by Protheroe & Morris.

WEDNESDAY, Nov. 7 — Clearance Sale of Nursery Stock at Shortlands Nursery, Bromley, by order of Mr. J. B. Bryant, by Protheroe & Morris. Great Sale of Fruit Trees and General Nursery Stock, at the Hounslow Nurseries, Middlesex, by order of Messrs. S. Spooner & Sons, by Protheroe & Morris (three days). Enormous importation of 39 825 Japanese Lilies, also Araucaria excelsa, &c., at Protheroe & Morris' Rooms. Dutch Bulbs at Protheroe & Morris' Rooms.

THURSDAY, Nov. 8 — Dutch Bulbs, at Protheroe & Morris' Rooms. Plants from Belgium, Roses, &c., at Protheroe & Morris' Rooms.

SATURDAY, Nov. 10 — Dutch Bulbs, at Protheroe and Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—44°.

The Wheat Crop and the Weather.

In addition to its direct importance to the agriculturalist, the following letter with which we have been favoured by Sir John Lawes is of very great interest to physiologists and gardeners. Wheat is an annual, and is less dependent on the character of the previous season than a perennial or a fruit tree would be. Possibly, however, the difference is not so great as might be imagined, for the proper maturation of the seed is, of course, every whit as important as that of storing of food in the bark, which gardeners include in the term ripening the wood. In any case, as the ripening is, in the case of Wheat, rounded off in a single season, the influence of the climatal variations on that ripening is clearly defined. Moreover, we have not only the seed to consider, but the vegetative organs, or straw. The extensive and varied experiments at Rothamsted, dating in continuous uniform sequence under identical conditions, except as to season, from 1844, are, therefore, of the highest possible value to cultivators and seed-growers :—

THE WHEAT CROP OF 1894.

To the Editor of the "Gardeners' Chronicle."

"The aggregate Wheat crop of the country in 1893 was the worst in point of quantity since 1879, and it was the worst in point of value in the present century. Our bad Wheat crops are generally grown in wet summers, and under such conditions a deficiency of grain is frequently more or less compensated by a large amount of straw. But the crop of 1893 was even more characterised by deficiency of straw than of grain. Whilst people generally were rejoicing in the magnificent season, which from the beginning of March was one of almost perpetual sunshine and drought, the unfortunate farmer was left not only with scarcely any hay-crop, but with hardly any straw for either food or litter for his stock; and the price of his grain fell to a lower level than it had ever reached before; indeed, of the many bad years which the farmer has recently had to face, 1893 may perhaps be considered as upon the whole the worst.

"It is fully recognised that the weather has a very important influence on our crops, but it is very seldom that we have two seasons in succession which show such remarkable distinctions in their influence on agricultural production. As the Rothamsted experimental Wheat-field is cultivated as nearly as possible in the same way every year, the seed is sown as nearly as possible at the same time, and the same manures are applied to the same plots year after year, the results afford a measurement of the influence of the weather of each year, which cannot be obtained under other conditions.

* Equal to 38 bushels at 60 lb. per bushel.
† Equal to 22½ bushels at 60 lb. per bushel.
‡ Equal to 36⅜ bushels at 60 lb. per bushel.
§ Equal to 40½ bushels at 60 lb. per bushel.
‖ Equal to 36⅝ bushels at 60 lb. per bushel.

Comparing first the produce of 1894 with that of 1893, it is seen that the unmanured plot gives very nearly twice as much grain in 1894 as in 1893, namely 18 bushels per acre, against only 9¾ bushels in 1893. The farmyard manure plot has given 45½ bushels this year against only 34¼ in 1893. It is worthy of remark that, contrary to what is usually the case, the farmyard manure crop was laid earlier, and more completely, than that of any of the other plots. The farmyard manure gives, as a rule, more even produce, and is less influenced by good or bad seasons than the artificial manures. This was especially noticeable in 1863, which was the year of the highest produce of grain yet obtained in the experimental field, and of the highest produce of straw, excepting that of the present year, 1894. In 1863 the farmyard manure plot gave 44 bushels, whilst the three artificially-manured plots gave, respectively, 53¾, 55¾, and 55½ bushels. In 1893, the same three artificially-manured plots gave only 20¼, 21¾, and 19½ bushels, whilst this year they have given considerably more than twice as much, namely, 48⅜, 49, and 47 bushels.

Although the yield of grain per acre was thus, under all conditions of manuring, unusually high in 1894, and unusually low in 1893, the quality of the grain, as shown by weight per bushel was, owing to the bad ripening weather, considerably the lower in 1894. Still, it considerably exceeded the standard weight of 60 lb. per bushel.

It is, however, in the difference in the quantity of straw produced in 1893 and 1894, that the distinction between the growth of the two seasons is most clearly shown. Thus, in 1893, the three artificially-manured plots gave, respectively, 11¾, 13⅞, and 11½ cwt. of straw per acre; whilst in 1894 they gave 53⅞, 64¾, and 56⅜ cwt. per acre—that is on the average not much less than five times as much in 1894 as in the immediately preceding year.

Referring to the characters of the season of 1894, in which such extraordinary crops have been grown, it may be stated that September (1893) was very dry and rather cold, October very wet and warm, and November fairly dry; whilst in December there was about an average fall of rain, with considerably above the average temperature. The first week in January (1894) was very cold, showing, over a large area of the country, 10° to 12° of frost; the remainder of the month was, however, warm, the third week being unusually so, with an average rainfall. February was, upon the whole, very warm, and drier than average. The greater part of both March and April was also unusually warm, with only moderate rainfall. May and June were, however, both cold months, with upon the whole a considerable amount of rain. The beginning of July was warmer than average, with but little rain; the rest of the month was cold, with more or less rain almost every day, making in all, however, even rather less than an average for the month—though from its continuity damaging the crop considerably. In August, again, there was more or less rain almost every day, with occasional rather heavy falls, giving, in some localities, an excess for the month; but fortunately the temperature was generally below average, or there would probably have been more damage than there was from sprouting.

Thus, the winter and early spring were, upon the whole, favourable for luxuriance, and the summer favourable for continued vegetation, but not for ripening. It is, however, difficult to account for the great bulk of Wheat and other crops without taking into consideration the remarkable characters and results of the previous season. Owing to the drought and high temperatures of 1893, much of the otherwise available fertility of our soils was locked up and useless for the crops of that year. The results in the experimental wheat field afford an interesting illustration on this point. Not only were some of the spring-sown manures observed on the surface of the ground at harvest, but the drainage-waters collected from the various plots after the harvest of 1893 and before the sowing of the greater part of the artificial nitrogenous manures early in 1894, were considerabiy richer in nitrates than usual at that period; and it was doubtless in great part owing to the large amount of nitrates in the soil that the Wheat plots showed unusually luxuriant winter growth. It is of course impossible to say how much the crops of the country generally have this year benefited by such accumulations of unused fertility; but it is reasonable to suppose that they have done so to a greater or lesser extent, as hay, grain crops, Beans, and even roots, have all shown very good growth.

Unfortunately, however, the Wheat lacked the golden hue which indicates fine condition, the result of

The Flower Garden, Blickling Hall, Norfolk.

favourable ripening and harvest weather; and there can be no doubt that a large proportion of the crops of the country has suffered more or less from bad maturing and harvesting. It was in the southern and earlier districts of England that the crops suffered the most; whilst in the later districts the harvest weather was less unfavourable. The cutting of the Rothamsted experimental Wheat was commenced on August 8; but the crop was not completely carried until August 29.

Comparing the produce of 1894 with that of each of the three years of highest produce previously obtained, the figures show that in 1894 the yield of grain by farmyard manure was higher than in either 1863, 1854, or 1864. The average yield per acre of grain on the three artificially-manured plots, though less in 1894 than in 1863, was nearly as high as in 1864, and considerably higher than in 1854. The produce of straw by farmyard manure was very much higher in 1894 than in either of the other three years of high productiveness; whilst the mean of the three artificially-manured plots indicated more straw in 1894 than in 1863, and considerably more than in either 1854 or 1864. The produce of 1894 showed, however, on the average of all the selected plots, a rather lower weight per bushel than that of 1854, and considerably lower than that of 1863 or 1864. The selected experimental plots have in fact this year indicated nearly as high an average produce of grain per acre as in 1863, the year of the highest yield of the 51 of the continuance of the experiments; and more than in either 1854 or 1864, the second and third in order of high productiveness. This year has also given an average of considerably more straw than ever before; and though not a high weight per bushel, a considerably higher one than the official standard average of 60 lb.

It has abundantly been proved that, not only on the average of years, but in a very great majority of the individual seasons, from 1852 up to the present time, the calculated average produce of the selected plots in the experimental Wheat field, has very closely indicated the average yield per acre of the United Kingdom at large. In a few exceptional seasons, however, especially when from local damage or other causes there has been more than usual irregularity in the crop in different parts of the country, and also when, a few years ago, first one half and then the other half of the experimental plots had to be left fallow for the purpose of cleaning, some modification of the direct indications of the selected plots has had to be adopted. The present season, 1894, must certainly be considered one of unusually variable and exceptional character over the different districts of the Wheat-growing area of the country; and, accordingly, judgment must again be exercised in forming an estimate of its average yield. The average produce of the selected plots shows 38 bushels per acre at 60 lb. per bushel. Having regard to the reports of the progress and condition of the crop in different localities, it is out of the question to assume so high an average yield as 38 bushels over the country at large; and after careful consideration, I am disposed to adopt as probable an average of 33 bushels per acre, at 60 lb. per bushel; though I should not be much surprised if it should turn out to be even higher than this.

The average population for the harvest-year ending August 31, 1895, is estimated at a little over 39 millions (39,001,405). Taking the consumption to be 6 bushels per head (at 60 lb. per bushel), the amount of Wheat and flour reckoned as Wheat, that will be required to feed the population is almost exactly 29¼ million quarters (29,251,054). The area under wheat in the United Kingdom was rather less than 2 million acres (1,977,304). This area, at 33 bushels per acre, would yield a home crop of rather more than 8 million quarters (8,156,379); and deducting from this 2 bushels per acre required for seed, equal 494,326 quarters, there remain about 7⅔ million quarters (7,662,053) for home consumption. The estimated requirement from stocks and imports would thus be more than 21½ million quarters (21,589,001). If, however, as will probably be the case with such extremely low prices prevailing, a larger amount of Wheat than usual should be given to stock, the requirement from other sources than the home crop will be so much the greater. Not only, however, is there this year more than usual uncertainty in the estimate of the yield of the home crop, but the fluctuation in the stocks of foreign grain in warehouse in the United Kingdom has to be taken into account. According to Dornbusch's estimate, the stocks in warehouse at the commencement of the harvest-year were about 1 million quarters less than at the same period in 1893. Upon the whole, the evidence points to the conclusion that probably more than 22 million quarters will be required to be provided from stocks and imports within the current harvest-year. *J. B. Lawes, Rothamsted, October* 23, 1894."

Royal Botanic Society of London.—At a meeting of the Council of this society last Saturday, the subject of opening the gardens to the public was considered, but, seeing that all students have free admission, as well as all persons seeking information relative to the many vegetable products in connection with the Arts, Sciences, and Manufactures, that others can obtain admission by tickets from Fellows of the Society, and bearing in mind the weight of the high rent, rates, and taxes, the council regretted they could not afford general admission to the public, but that the experiment would be made on one day next season, probably Whit-Monday.

National Chrysanthemum Society.—A meeting of the General Committee was held at Anderton's Hotel, Fleet Street, on the 29th ult., Mr. R. Ballantine in the chair. There being a large attendance, some further amendments to the rules were considered and adopted, the same to be submitted for adoption at the annual general meeting in February next. It was stated by the Secretary that the President of the Society, Sir Edwin Saunders, would preside at the annual dinner of the Society on November 29 next. A resolution was unanimously passed instructing the Secretary to invite to the judges' luncheon on November 6 the whole of the members of the Floral Committee, in consideration of the services rendered to the Society by them as members of that body. A sub-committee of twelve persons, together with the officers *ex officio*, was appointed to revise the schedule of prizes for 1895. Twenty-two members, including two Fellows, were elected, and the People's Palace Horticultural Society was admitted to affiliation. The Secretary reported, that with the addition of the members elected that evening, there had been added to the roll of membership during the present year 101 ordinary members and nine Fellows, together with sixteen affiliated societies. A vote of thanks to the Chairman brought the proceedings to a close.

The Royal Gardeners' Orphan Fund.—A meeting of the committee was held at the Hotel Windsor on the 26th ult., Mr. W. Marshall in the chair, the attendance being small owing to the wet evening. The Hon. Secretary announced the following special amounts as received during the recess: J. Bertram, Esq., as a thank-offering on his restoration to health, £5 5*s.*; Wakefield Paxton Society, £10; The Sandringham Estate Cottage Garden Society, £5; J. Slater, Esq., £5 5*s.*; Beddington Flower Show, per Mr. G. W. Cummings, £2 7*s.* 6*d.*; The *Gardeners' Chronicle*, in small sums, £2 4*s.* [contributed by correspondents who availed themselves of our services in naming fruits, flowers, &c.]; J. Selway, Esq., Dover, £4 10*s.*; Mr. J. Miles, Southampton, box, £3; Mr. W. Miller, Underley Hall, box, £1 17*s.* 6*d.*; The Bradford Gardeners' Mutual Improvement Society, £1 16*s.*; Mr. T. Turton, Maiden Erlegh, Reading, £1; Mr. W. Farr, Isleworth, box, £1 2*s.* 8*d.*; Mr. C. Sutton, Chevening, box, 11*s.*; Mr. E. T. Hazelton, Brocklesbury Park, box, 9*s.* 6*d.*; Mr. Richard Dean, sale of flowers at the Royal Aquarium, 12*s.*; Mr. W. G. Head, Crystal Palace, Sydenham, box, 8*s.* 7½*d.*; Crystal Palace employés, £1 19*s.* 2*d.* The Hon. Sec. presented a cash statement to date which was of a highly satisfactory character, and a resolution was passed authorising the investing in consols of a further sum of £500. The case of one of the children of the Fund whose mother has married since the date of the election came up for consideration, and the committee decided that the child was no longer eligible (according to Rule 13), the circumstances of the mother having so altered as to render further assistance unnecessary. The Committee decided that there should be an election at the annual meeting to be held in February next, and that applications on behalf of candidates must be sent in to the Secretary not later than December 11. The Chairman announced that Mr. Harry J. Veitch had kindly consented to preside at the next annual summer festival of the Fund.

Physalis Francheti.—Our description of this fine new species of Bladder Cherry (see p. 434), hardly did justice to its splendid colour. The calyx of the flower is at first green, but as the calyx rapidly expands to an even larger size than the examples shown in our illustration at fig. 57, the colour changes to pure sulphur-yellow. This quickly changes to bright yellow, then orange, and at length to a brilliant orange-scarlet. The long peduncle changes in a like manner from green through sulphur, to scarlet, and as maturity is reached, the ovary is also bright scarlet. The harmonies of colour, pale and dark green, sulphur, ochre, orange, and scarlet, are most striking. We hear the plant is not an annual, as we had supposed, but has a perennial rhizome.

Parish Councils.—It is most sincerely to be hoped, but hardly to be expected, that party politics will not be permitted to influence either the election or the doings of these bodies. Many gardeners will be eligible as voters or even as members of the Council, and there are many questions in village economy where their special knowledge would be most useful. A "Parish Meeting" will be held in every village in the course of December next, and the principal business of this meeting will be to elect a "Parish Council." Rate-payers and those entitled to vote at parliamentary (or County Council) elections can also vote at the parish meeting. They can vote for whomsoever they please, provided the person for whom they vote has lived in the village, or within three miles of it, during the last twelve months. The Parish Council, so elected, will have the management of the affairs of the parish, and of all charities that are not specially connected with some church or chapel. These latter will still be under the management of the authorities of the particular church or chapel to which they belong. The Council will have the power of procuring allotments at a reasonable rate. A leaflet explanatory of the principal provisions of the Act may be had from the Kentish District Times Co., Ltd., Bromley, Kent. For those who require fuller information, Mr. G. F. Chambers' *Popular Summary of the Law relating to Parish Councils and Meetings* may be recommended. It is published by Stevens & Sons, 119, Chancery Lane.

Bournemouth Gardeners' Association.—It is stated in the *Bournemouth Observer*, that Mr. D. T. Fish gave his second and concluding lecture on "The Diseases of Fruit Trees," at the Tregonwell Assembly Rooms, on Tuesday, October 18. The president (Dr. Hitchcock) again occupied the chair, and there was a large attendance. The lecturer, in his opening remarks, called attention to the various exhibits of fruit and flowers, consisting of a collection of Apples, Strawberries in pots, and a basket of ripe fruit grown in the open air, by Mr. J. Kettlee. A large basket of Celosias by Mr. Stevenson, seedling Nerines by Mr. H. Elliott, and examples of healthy young fruit trees by Mr. Kettlee, added much to the interest of the meeting. Mr. Fish, in proceeding to speak on special preventatives of disease, gave numerous remedies and dressings to be applied, and concluded with some remarks on various insect pests which prove so destructive to fruit trees. The lecture was illustrated by coloured drawings and diagrams,

and was very attentively listened to throughout. A hearty vote of thanks was accorded Mr. Fish for his instructive lecture, also to the chairman for his continued interest and support.

The Peebles Leek Show, Etc.—The Leek forms a common object of exhibition in northern parts of the country, amateurs and gardeners going far and wide with their produce. At Peebles recently, a show was held by the Leek Club at the Chambers Institution, and Leeks were shown by Mr. A. Dickson, Glenormiston, the six roots weighing 17 lb. 7 oz., as against 16 lb. 14 oz., the weight of the heaviest last year. The best blanched six Leeks were shown by Mr. McIntyre, The Glen Gardens. Besides these homely vegetables, in th. cultivation of which much skill is required, and special manures are employed (we believe sulphate of potassium), there was a very excellent exhibition of seasonable vegetables, special prizes for excellence being awarded. A Cabbage, variety not stated, of a weight of 21 lb. 10 oz., was shown by Mr. W. Davidson, Cringletie. Last year the heaviest was 22 lb. 10 oz. Evidently Peebles is strong in vegetable cultivators, for at the recent meeting of the horticultural association of that town, Mr. Jas. McNiell, of Priorsford, gave a paper on the Kitchen Garden, which was very favourably criticised by the audience. A lecture will be given at the next meeting by Mr. Mungo Temple gardener at Carron House, Falkirk, entitled "Failure in Vine-growing, and its Causes."

Lecture on Allotments and Cottage Gardens at Beccles.—On Wednesday evening, October 24, Mr. J. Batters, gardener to J. G. Kenyon, Esq., Gillingham Hall, Beccles, gave a lecture on the above subject at the Rectory-room. The lecture was held under the East Suffolk County Council, and in connection with the Cottage Allotment Show, which the committee of the Beccles and District Chrysanthemum Society have arranged to hold in the Town Hall on Wednesday. The Vice-President of the Society, Mr. E. Masters, C.C., presided, and introduced the subject of the evening in a few well-chosen remarks. Mr. J. Batters then described a lengthy list of vegetables and their culture, illustrating his remarks with some excellent specimens of his own growing.

Bulb Growing.—At a recent (October) meeting of the Kyrle Society, M. Robert Sydenham read a paper on "Bulbs and their Cultivation," in which he spoke of the various methods of growth, propagation, and culture of bulbs. The lecture was interspersed with various illustrative examples.

Birmingham and District Amateur Gardeners' Association.—At the meeting of the above, held on Wednesday, October 3, at their rooms, 116, Colmore Row, the Secretary (Mr. W. B. Griffin) read a paper, prepared by Mr. F. Nash, of Bath, on "Lilies and Irises." Mr. Nash dealt with the growth of these plants in a very thorough and able manner, specifying the position, soil, and general treatment which each required. Mr. Nash also gave a select list of species and varieties, their height, colour, &c. A vote of thanks was passed to Mr. Nash for his paper.

Chrysanthemums.— A third edition of *Les Chrysanthèmes*, by MM. Bellair and Berat, and published by O. Doin, Paris, is before us. It is a small treatise, very clearly written, and highly to be recommended to those who read French with facility.

"Annals of Horticulture for 1893."—This is intended as a "Witness of passing events and a record of progress" in horticulture in North America during the year 1893. It includes a history of the World's Fair at Chicago, where Prof. Bailey spent nearly four months for the express purpose of compiling this account. Although, of course, mainly concerned with the horticultural interests of the United States, there is much that renders the little volume of service to horticulturists on this side of the Atlantic. So convenient a work of reference will be very serviceable in our horticultural libraries. Among other things we note a legal decision of the United States Supreme Court that a Tomato is a "vegetable." The account of the Horticultural Exhibition at the World's Fair will be useful as a record, and it is some satisfaction to find that there are at least some things—such as judging at flower shows, which are better done by effete Britishers than by progressive Americans. Among curiosities of classification, such as must always occur in such gigantic enterprises, we find the exhibits of wine included under horticulture, those of whisky under agriculture, and cider under both. The book is edited by Prof. L. H. Bailey, of Cornell University, Ithaca, New York, whose competence has to be spoken of in the superlative, and is published by the Orange Judd Company of New York. It may be procured from Williams & Norgate.

Newcastle-on-Tyne Chrysanthemum Show.—The executive of the Newcastle-on-Tyne Horticultural Society are determined not to be behindhand in relation to the Chrysanthemum. The first show will be held under the auspices of this old-established Society on November 21 and 22, in the Olympia, Northumberland Road, Newcastle-on-Tyne. Exhibitors will do well to write to the Secretary, Mr. Jas. J. Gillespie, Jun., Cross House Chambers, Westgate Road, Newcastle, for schedules and fuller information. Taking into consideration the popularity and success of both the spring and summer shows, this new departure should prove so encouraging to the committee as to make it an annual affair. The schedule is a comprehensive one.

"American Gardening."—Our contemporary, *American Gardening*, is now under the editorship of Mr. Leonard Barron, whose practical experience in various departments of horticultural work render him well fitted for the post. We wish the paper and our late coadjutor all prosperity in this, their new connection.

Somerset County Education Committee.—Mr. F. Nash, manager to Messrs. George Cooling & Sons, nurserymen, Bath, has been engaged to deliver a course of six lectures on "Cottage Gardens and Allotments," at Hinton Charterhouse. The course began on Wednesday, October 31, with a lecture on "Hardy Fruits."

The Kew Index.—The third part of this colossal work has just been issued. It includes the names of plants from Ka to Ps, so that it is now within a measurable distance of completion. It is impossible to over-estimate its value to students and to those who have to refer to the names of plants. We have already spoken of the nature and scope of the work, so that it is now only necessary to congratulate the compilers on its steady progress, and to repeat our expressions of gratitude to them for this invaluable boon. It is published by the Clarendon Press, Amen Corner, E.C.

Book Notice.

The Wild Garden.

The fourth edition of Mr. Robinson's well-known book (published by Murray) requires but little introduction to readers who remember the publication of the first edition twenty years ago. Others less familiar with the work should note that the somewhat misleading title, *The Wild Garden*, has no reference to British wild flowers grown on cultivated land; but rather refers, to quote the author's own words, to "placing plants of other countries, as hardy as our hardiest wild flowers, in places where they will flourish without further care or cost." It may be added that these foreigners are to be encouraged to dwell in the natural or "wild" manner in which they appear to most advantage; not formally arranged, clipped, or in any way forced.

The one chapter in the book on "The Garden of British Wild Flowers" does, however, treat of the beauty of certain native species, and their suitability for cultivation. Too frequently, we agree with Mr. Robinson, are many of our British plants overlooked and excluded from gardens where they might well be used in addition to, or in the place of, the costly exotics preferred by many modern gardeners.

In concluding the notice of this book, attention should be drawn to the woodcuts which illustrate it, and show many a pretty picture of plants growing amid appropriate surroundings—not trimmed and trained to suit the florist's convenience.

CHRYSANTHEMUM, HAIRY WONDER.

This is the best of the hirsute section yet sent out, and is one of the most curiously distinct of Chrysanthemums. As will be seen from the illustration (fig. 71), the flowers are of large size and capital substance, whilst each floret is studded singularly with numbers of hairy appendages. The colour of the flower is buff, with an apricot centre. Our engraving was from a flower shown by Mr. H. J. Jones before the Royal Horticultural Society at the last meeting, when it received an Award of Merit. On the succeeding day, the National Society awarded it a First-class Certificate.

CHRYSANTHEMUMS ABOUT LONDON.

(Continued from p. 502.)

Chrysanthemums at the Royal Horticultural Gardens, Chiswick. — The collection of these, placed in the Fig-house and in the Paxton-house, is now in a fairly good condition, and the plants are mostly such as might be well grown for decorative purposes. Amongst early and semi-early Japanese varieties recently noted may be mentioned Roi des Précoces, perhaps the finest of all kinds for decorative use, flowers rich bright crimson, wonderfully free and effective; O. J. Quintus, pink-mauve, also very free; the best of its colour is William Holmes, large flower, rich crimson, with golden reverse; Alexander Dufour, rosy purple, fine bushy habit, free and good. Other good Japanese sorts observed are Mr. John Laing, dark crimson-red, shaded velvety-brown, speckled gold; Eynsford White, large, florets semi-drooping, somewhat in style of Avalanche; Lady Selborne is also a good white, and valuable on account of its being very early; the old, but still good and useful, Elaine, is quite worth a notice; Source d'Or, bright orange, shaded gold; Stanstead White, very large, white petals semi-incurved; Viviand Morel, large flower, long drooping florets, blush-mauve on a white ground; a charming and attractive flower is W. Tricker, delicate rose, Amongst good incurved flowers we noted Golden George Glenny—this is a sport from Mr. George Glenny—a type of small but most beautifully formed flowers, a fine flower for decorative purposes, grown without stopping or disbudding; Golden Beverley, Golden Canary—a sport from the latter is Mr. Bunn, but a deeper colour and finer flower; Mrs. George Rundle, pure white, small, but of fine form. *J. B.*

Mr. W. Seward, Hanwell.

This raiser of varieties has a very promising batch of Seedlings this season, few of which will be brought out this year, some of the plants only bearing one flower, and others are very late. Doing exceedingly well are the following Japanese varieties: William Seward (Seward), a very fine deep rich blackish-crimson, florets long and of firm texture; J. Shrimpton (Seward), will probably prove to be one of the finest dark Chrysanthemums grown, colour brilliant crimson-scarlet, bright golden reverse, just showing as the florets expand; Charles Davis is a golden sport from the popular Viviand Morel, canary-yellow, tinted rosy-bronze; Viviand Morel is lighter in colour than usual. Colonel W. B. Smith looks like making some good high-built flowers, rich golden-bronze, petals very broad and long. The good and

well-known varieties, Avalanche and Sunflower, look well; Eda Prass, a large variety, with stout broad petals of a silvery-pink colour, is looking remarkably well; Robert Owen, one of the best of the incurved Japanese, will not be at its best for another fortnight; Mrs. W. Seward is a very promising white. *J. B.*

a deal of time in order that the florets may be removed as soon as they have changed colour. Latterly, Mr. Stevens has grown Chrysanthemums largely for decorative purposes and for the supply of cut blooms, and may be a larger number of plants have been grown than there is proper room for, at any rate it is intended next season to grow a very much reduced

certain varieties are very much better and prettier cultivated in sprays, and these are cut and sold in this manner, most of the blooms being required to supply the two florists' shop belonging to Mr. Stevens in the High Street, Putney.

Sunflower is always grown largely, and is considered one of the finest yellows for the florist. It

FIG. 71.—CHRYSANTHEMUM HAIRY WONDER. (SEE P. 538.)

MR. GEO. STEVENS, PUTNEY.

St. John's Nursery, Putney, is situate so close to the river, that in a dull damp season, when Chrysanthemum growers experience annoyance through the damping of blooms, Mr. Stevens' collection suffers considerably, and the present season is such an one, care being necessary generally in more or less degree to prevent loss from damping. Here the injury is most marked, and some plants have all their blooms quite spoiled from this cause, and others affected in less degree require number in the same space, and under similar conditions with a view to prevent damping as much as possible. Many other growers need to make and carry out a similar resolution. Growing the plants for the supply of cut blooms, Mr. Stevens has in company with many of the newest varieties in commerce, a good number of plants of each of those kinds especially valuable for that purpose, and in speaking of cut blooms we mean the best sample of such, for at this place most of the varieties are thinned and large blooms are obtained; but on the other hand

usually does very well here, and seldom damps. A companion to Sunflower is W. H. Lincoln, also in good quantity and specially suitable for this work. A house almost full of Elaine is evidence that this fine old variety is not yet without value; and Elsie, a very pretty pale straw-coloured Japanese, is a real gem for florists' work, but it should never be thinned—grown in sprays as it is here, it is most beautiful. William Seward was present in many instances, and John Shrimpton, too, doing well, and this fine-coloured flower stands

the damp much better than the first named. Etoile de Lyon had good blooms, and Baron Hirsch was very numerous and good, as also Florence Davis, a rose-coloured sport from Empress of India, which may make a valuable incurved, but it does not appear strong enough this season to finish very large blooms. It will be worth trying again however. E. Molyneux is a good thing for the florist, and in its way is yet unbeaten; Richard Dean in close proximity to it, but has not yet proved to be equal. One of the best for the market, in Mr. Stevens' opinion, is the old Roi des Précocés, a small scarlet flower with yellow reverse; it is a neat little Japanese. Several blooms remained of Preſét Robert, the Japanese incurved, flower amaranth, with silver reverse, certificated at the last meeting of the Royal Horticultural Society.

One wonders that the Pompon section and the single-flowered varieties are not cultivated more for florists' work.

Mr. Norman Davis, Camberwell.

At the Lilford Road Nurseries, we found Mr. Davis personally busy among his Chrysanthemums; but he was not very flattering in his opinion of the weather during the season, or of its behaviour at the present. All the houses are well filled with plants, and many of them, to all appearance, are not likely to bloom before Christmas, although, of course, a good number are already in flower. No attempt has been made to mass the plants in flower into one house to cause a display, and we understand that Mr. Davis does not intend to exhibit during the present season. There are plenty of good plants though, and many new sorts, so that an inspection of the collection is very far from uninteresting. Immediately on entering the house some capital plants of Charles Davis cause a display, and a remark from us anent the popularity of this sport, is followed by one from Mr. Davies, to the effect that it had gone to all parts of the world where Chrysanthemums are specially cultivated. So far, its colour is not quite up to the mark this year, but the later blooms may be better. Here we found several plants of the splendid acquisition Louise, bearing such large flowers of delicate flesh colour, and combined with a habit which may be described as perfect. Mr. Davis says it is good on any bud, and it is always remarkably dwarf. The full-flowered Japanese Mrs. E. G. Hill, was next noticed, and an American variety called Rosstrevor, another deep-flowered Japanese, in the way of Coronet, but narrower petals; the colour is orange fading to a shade of yellow. After noting some plants of William Seward, and of the yellow sport from Lady Selborne, a splendid decorative variety, an American variety called William Bolia, was attractive. Its florets are light amaranth with silver reverse, and are twisted. Mr. Davis remarked a curious circumstance that in so late a season as the present, Mrs. F. Jameson usually opening late was already in bloom. Florence Davis has done as well as any variety this season, and John Shrimpton may be spoken of similarly; both of these will be exhibited well. The new President Borel had carried fine large blooms, but they were nearly past. Mrs. E. S. Trafford is the name given to a sport from William Tricker. This rosy-bronze variety is in all respects save colour, similar to the type, and is valuable. Souvenir de la Petite Ami is an exceedingly pure white Japanese flower, and Mr. Davis says he prefers to consider it a first-clase decorative variety, suitable for half specimens rather than a subject for producing show-blooms. Commandant Blusset (Calvat) is a good flower of crimson amaranth with white reverse, and Vice-President Calvat, an extremely strong grower, has large crimson flowers with bronze reverse. It is capital when the flower is quite finished. The above are a few of the interesting varieties only at Camberwell.

Mr. W. Wells, Earlswood.

At the Earlswood Nurseries, near Redhill, Surrey, will be found a fine collection of well-grown plants, thoroughly representative of the new and first-class varieties, particularly in the Japanese section. In regard to culture, the success obtained is very superior to anything we have before observed here. The plants have been much better grown; the character of the wood and the persistency and texture of the foliage sufficiency demonstrate this, even apart from the flowers, which however, are very good, and many of the Japanese flowers will make a good stand on the exhibition tables, for it is Mr. Wells' intention to exhibit a little during the season that is now commenced. Until this season Mr. Wells has done as many other growers do—he has had too many plants in a given area. It will only be appropriate if we mention first the variety that Mr. Wells considers to be the novelty of the year, which at present has been seen only by a few growers, though it was shown before the last meeting of the Royal Horticultural Society. Ethel Amsden is the name of this new comer, which is no seedling but a sport from Viviand Morel. The flowers are quite green, and even when fully expanded there is but little of anything else to be seen; the shade becomes a little lighter perhaps, but not greatly. Whether it will be liked and grown permanently by many, we are not prepared to say, but there is little doubt that as a novelty it will have a very large run, and it is likely to be grown largely for the florists and for market. A very similar variety was figured lately in one of the Japanese horticultural publications. When we see people in town with green Carnations artificially dyed as button-holes, there appears to be some likelihood that a naturally-green Chrysanthemum will be popular for that and similar purposes. Mr. Wells has a small span-roofed house full of it, and we saw thousands of flowers upon these plants, most of which blooms have been already sold to a London florist at 6*s.* a dozen. In habit it is apparently similar to the type, and we think it is most likely to be appreciated when grown with little or no thinning rather than as plants to produce large flowers. Pea-green is the nearest description of the shade we can give, though possibly it is a little lighter. M. B. Spaulding, a new American-Japanese, was noticed as a very large flower with long irregular lemon-yellow-coloured florets; it is a very strong grower. Autumn Tints, another new one, looks likely to be a moderately-sized flower, but the splashed florets are pretty. Mrs. Jeremiah Coleman, sent out from here last season, is a white Japanese, shaded with violet, and is not quite so large this year. W. G. Newett is very fine here, and will be useful as a good white Japanese flower with a pale lemon centre. A good incurved Japanese is Miss Dorothy Frankland, a seedling from W. H. Lincoln. It is deeper than Lincoln, the florets are forked, and the plant is about 6 feet high; it has been certificated by the Royal Horticultural and the National Societies. Frank Wells is a Japanese flower, much similar in form to Mdlle. Thérèse Rey, but in colour is violet-rose, with pale rose reverse. Souvenir de la Petite Ami (Calvat) is evidently going to make a grand white Japanese. The blooms are capital, on very dwarf plants even; it is easier to do than Avalanche, and will probably be preferred. Cecil Rey, sent out by Beckett last season, is a good yellow Japanese, with good long florets, and a nice habit. Some wonderfully good buds are bursting of Beauty of Castlewood (Spaulding), sent out a year or two since; the florets are an inch in width. There will be one very good bloom of Alpheus Hardy, a pretty variety, but most growers are obliged to give it up. President Borel, and Duke of York, both capital varieties, are seen in good form here. Mrs. M. Simpkin, though not good enough for an incurved, as described when imported, is, nevertheless, a pretty incurved Japanese bloom. The great salmon rose-coloured Japanese from America, called International, is noticed here, but they are not quite finished. American Flag will be liked as a novelty. The florets are white, striped with darkish crimson; the flower will be large when finished. Robert Owen is, without doubt, one of the finest Japanese incurved ever sent out. Its bright golden bronze flowers are doing very well here, and it is but little trouble; the variety is now well known. Flossie is the name of a pretty white decorative Chrysanthemum, grown here in quantity for very late blooms; the florets are tubular, and at the apex are notched, the blooms resembling—when grown without thinning—small pieces of wool. Baron Hirsch, and many of the incurved, are well done, but the flowers are late. Pompons and singles are also well represented, the stock of the latter being uncommonly large.

Ambleside, Wimbledon Park.

This is a small suburban residence in the south-western district, and close to Southfields Station. Mrs. Barclay may be congratulated upon possessing a very nice collection of about 400 well-grown plants, which include many of the choicer and newer varieties. The show they create is vastly superior to that met in many gardens with much greater pretensions. Mr. French, the gardener, takes much interest in Chrysanthemums, and usually exhibits more or less at the local shows. The most of the plants have been neatly arranged in a conservatory which adjoins the sitting-room, and here they make a very charming display. The wall opposite being finely clothed with Ferns planted in pockets, a pretty effect is produced. It says something for the autumn flower that such a collection can be well grown with but little labour. It will be seen from the following varieties that the collection is well up to date. W. Tricker, Viviand Morel, and Chas. Davis had done capitally, and the new Rose Wynne, a large white variety with good florets, was conspicuous. Florence Davis also had succeeded well, as had G. W. Childs, and G. C. Schwabe. Edwin Beckett is a fine yellow Japanese, and is thought to be richer than Sunflower. Gloire du Rocher has obtained a good colour, and Jno. Shrimpton, Wm. Seward, Louis Bœhmer, Alberic Linden, and Primrose League, were remarked. Frank Wells was pretty good, and Moonlight had four flowers which promised to be good when finished. The pretty fleshy-pink coloured Mr. E. G. Whittle, and Silver Cloud were good. Niveum, J. Haggett, and President W. R. Smith are all new, and of good merit. The plants of the collection generally are dwarf, and have retained their foliage to a large extent.

(To be continued.)

Home Correspondence.

THE LEAVES OF PLEIONE LAGENARIA.—It may interest some of your readers, particularly those who are, like myself, beginners in Orchid culture, to note that there is a curious unanimity in Orchid manuals in erroneously describing P. lagenaria as having a solitary leaf. I will instance four works: Nicholson's *Dictionary*, Comte du Buysson's *L'Orchidophile*, D. Bois' *Les Orchidées*, and Williams' *Manual*. Veitch's *Manual* leaves the matter open. These books mystified me completely last year, and it was only by taking flowers to Kew the other day, where they were at once identified, and plants shown to me, that I was made sure of what I had grown. At Kew, as with me, P. lagenaria pseudobulbs are surmounted by two leaves, even my smaller bulbs, hardly strong enough to flower. I have about three dozen bulbs, so speak from personal observation. *Tar.*

THE BLACK CURRANT-MITE.—Whilst fruit-growers must never lightly treat information of an entomological kind, so far as affecting fruit pests, yet it is well to regard what is often stated with some coolness and even scepticism. There are insects which we know only too well, and which no care in culture can keep away. Aphis will appear under any conditions, but then we know aphis and how to deal with it. Caterpillars, maggots, &c., we know, and how to check their depredations also. But the Black Currant-mite is so little known comparatively, that it needs much searching for to find. I I have never seen it or its effects on Currant-buds. [!!] There are myriads of gardeners in like case, and so far as evidence in relation to this insect goes, it is found almost exclusively where proper cultivation is absent. That would of course account for its non-appearance in good gardens. I have been reading a paper entitled "Recent Investigations on the Currant Bud Mite," taken from the *British Naturalist*, and the conclusion arrived at is, that where culture is good and old wood is cut from bushes every year, they being also helped to make strong fruiting

growth with the aid of manure-dressings, the Currant-mite gives no trouble, and is unknown. It is not at all a pest to make a bogey of. In the paper it is stated that large or unduly-swollen buds signify the presence of the mite. That remark will only apply locally, as nothing is more common than the presence of many very large plump buds on Black Currants; but then these, it will be found, produce a cluster of bunches in the spring, and not one only. However, it will be productive of no harm if Currant-growers will now examine their bush-buds, and dissecting them, look for the presence of the mite or its absence with a good glass. *A. D.* [Our correspondent must be unusually fortunate. Ed.]

THUIA GIGANTEA.—A good specimen of the above Conifer stands in the arboretum here, which is close upon 50 feet high, and measures 7 feet 10½ inches round the trunk at 3 feet from the ground. *J. Mayne, Bicton, East Devon.*

POSITION OF MALE AND FEMALE CONES.—In trees like the Cedar, having male and female cones, is it the case that some boughs always bear female cones and some always male? I ask the question because my Cedar is always full of male cones, but has very few female ones; but the ripened cones seem always to come on the same boughs. This year whereon there are perfect cones, they are on the branches on which perfect cones were last year, so that there are the green cones of this year standing close to and touching the brown cones of last year. In my tree the branches bearing female cones have no males, and those bearing males have no females. Does this at all fall in with your observations? If I am right, the same thing would of course apply to other fruits in more or less degree. *Henry M. Ellacombe.* [We do not think any rule can be laid down on this point. Ed.]

FRUIT AND FACT.—I see that, under the heading of "Fruit and Fiction," I am taken to task, pleasantly enough, for a supposed misdescription in an early work of mine. I would only say that the number of trees per acre is exactly that prescribed by my admired friend, the late Mr. Thomas Rivers, and that I have his very cordial approval of the description thus impugned by "Reader." Perhaps Dr. Hogg may bear in mind that he, and his brother pomologist just mentioned, honoured me with a visit *circa* 1865, and admired my pyramid Peach-trees, crimson with fruit *sub dio*, and standing only 4 feet asunder. But, of course, it never paid to do. While I am about it, I may just mention that my enthusiasm—referred to by "Reader"—though forty times annually disappointed, is not dead yet. With Duchess Pears, fine enough for exhibition, selling last week at 3*s.* per bushel, and Beurré Hardy, and Superfin, gone at 2*s.* 6*d.*, a grower is apt to grow sad, though he should not be described as a whiner and snapper for simply producing a fad or too, without even a sigh to burden them. If there is any *new* advice to come, here am I ready and eager for it. All as yet received has been anticipated some thirty years or more agone. I have tried the best salesmen in London and the local trade simultaneously, with the skill of the most advanced costermonger; I have packed in every imaginable way, and "graded" with the finest "degradatis;" my fruit is of the very best market kinds, Williams, Pitmaston, Marie Louise, Louise Bonne, Beurré Hardy, &c., yet here stands the fact that for the present year I have not sold a bushel at a paying price, and want to know when I shall do so. Now, instead of being angry, good tree-sellers, and writers up of marketing, and kitchen-garden lecturers, will you just tell me how to get more for a thing than anybody will pay for it? Without knowing aught of me, you vote in a body that I am a muff; because I cannot do what you take uncommonly good care not to attempt in purse and person, while you stimulate others to go in for it, and so to cast into your laps that substance which they shall never behold again. The motive of your "boom" is obvious; but no selfish motive can be ascribed to me; for I am too old to dread competition now, and in plain truth the money I drop annually here is not essential to me. I am heartily glad that you should push your trade; but surely it might be done without so many fibs. And let one of you—that would be enough—try it on a large scale; instead of nursing pet-stuff under glass, to make silly mouths water, and silly heads think "Oh, I could do that." When we find any of you in earnest going in for larger fruit-growth in the open, we shall believe that you are not to be compared to the racing-tipsters, who live on abstract prophesy, or the outside dealers in stocks who invest everybody's money except their own. I see that a gentleman attacks me because I have written books, and therefore have no right to grow fruit. Whether he himself began with drapery first, or gardening, I will not be rude enough to ask; but his objection may vanish—supposing his wit to be capable of light process—upon my solemn statement that I was a fruit-grower for ten years before I became a novelist. Haply, but for that dark investment, I need never have been charged with fiction. *R. D. Blackmore.* P.S.—Marguerite Marillet, now cracked up, is nothing else than Secrétaire Rodin, which I condemned years ago for bletting—a watery Pear at the best. Précoce de Trévouxe is Clapp's Favourite, sent out under a French name. Mr. George Bunyard is wrong in praising Beacon, Triomphe de Vienne, Magnate, and at least a dozen other Pears. We have too much rubbish already. *R. D. B.*

PEAS IN 1894.—The season of 1894 has not everywhere been a satisfactory one for Peas; complaints of not setting well have been made in some places, and in others aphis have been troublesome. Here, however, they have generally been good, and some kinds exceedingly so. Our first crop was Veitch's Extra Early, which was sown in turves early in January, and placed in cool pits. They were subsequently planted out upon a south border. In forwarding Peas under glass, with a view to planting them out, I prefer having them in cool pits to warm ones; they are more sturdy, and consequently do better after being planted out, particularly where the soil is heavy and cold, as it is here. Our successional early Peas were Chelsea Gem and William I., and they gave every satisfaction. The former, owing to its dwarf habit, is particularly useful for planting upon narrow borders or in exposed gardens, or where there is difficulty in getting stakes. It is a heavy cropper, and its Peas are good in quality. Of Main-crop varieties we grew Duke of Albany, Veitch's Main-crop, Criterion, and Autocrat. The first-named produced its large pods well filled and abundant, its haulm being both robust and free from mildew. This is one of the best mid-season Peas we have grown. Main-crop we tried for the first time, and in a limited degree. We like its appearance; it does not grow so tall as many mid-season Peas do, while it cropped very freely, and its long curved pods were closely packed with Peas of good quality. Criterion is generally well known, and its crop was good in every way, as it invariably is. For late crops, we grow Autocrat and Ne Plus Ultra. When we first grew Autocrat, I was not altogether satisfied with it; but the fault evidently rested either with the cultural conditions under which we tried it, or the character of the season, for subsequently it has proved to be an invaluable variety for late use. There are numerous early and main-crop Peas, but reliable late sorts are not plentiful. For many years Ne Plus Ultra has been our reliable one for this purpose, and it has been deservedly esteemed; so much so, that I am loath to discard it. Nevertheless, this I ought to do in favour of Autocrat. We have this year grown these two varieties side by side, and the newer kind has been decidedly the better; it has a stronger constitution, and continues in bearing over a greater length of time, while its quality when cooked is unsurpassed. The length of time that Autocrat continues to grow and blossom—a property particularly desirable where space for vegetables is limited—is worthy of remark; as is also the satisfactory way in which it fills its pods until cut down by frost. This autumn we had a supply of young Peas from it until October 25, when it was stopped by frost. *Thos. Coomber.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

October 23.—Present: Dr. M. T. Masters, in the chair; Mr. McLachlan, Dr. Bonavia, and Rev. G. Henslow, Hon. Sec.

Coniferæ.—Dr. Masters exhibited a series of cones and branches of various trees exhibited at the late Conference at Chiswick. They included very fine specimens of the cones of Abies cephalonica, A. magnifica, Cedrus Deodara—which rarely fruits in this country, Abies Nordmanniana, A. Veitchii, remarkable for developing the bracts under cultivation; A. ajanensis, and Pinus Pindrow. There was also a portion of a trunk of a fine plant of Thuia gigantea, nearly 4 inches in diameter and twenty-five years old, the tree at Orton being 60 feet in height. It was suggested by Dr. Masters that this tree might form a good substitute for the Larch, which appears to be dying out in many places. The specimens shown were grown in the gardens of the Marquis of Huntly at Orton, by Mr. Harding; in those of Viscount Powerscourt in Wicklow, by Mr. Crombie; and of Sir P. Murray in Fife, by Mr. Croucher.

Chionodoxa Bulbs attacked by Aphis.—Mr. McLachlan exhibited some bulbs which had a shrivelled appearance. He observed that he had received specimens from two different sources. On examination, there were seen numerous aphides beneath the outer skin of the bulb. It was named Aphis subterranea, and had not been known before to attack bulbs, though it infests the roots of many plants, to which it does not prove very injurious. The aphis, therefore, had probably got to the bulbs from some fibrous-rooted plant. Mr. McLachlan regarded the attacks as being serious, because the aphis was protected by the skin of the bulb from insecticides. He suggested the removal of the skin when the bulb was first lifted, and a thorough examination be made. He thought that perhaps if the ground were treated with bisulphide of carbon it might prove effective. It was also suggested that a trial might be made of putting the bulbs under cover, and submitting them to the fumes of tobacco, or where spirits of turpentine could evaporate. Examination should be made to see the bulbs themselves were not injured by the process. Of course, all old skins should be burnt.

Lawns damaged by Ferncha fers.—Mr. McLachlan showed the larva of a beetle, Rhizotrogus solstitialis, which sometimes does considerable damage to lawns.

Phenological Phenomena.—A communication was received from the Secretary of the Royal Meteorological Society alluding to the appointment of a Committee to investigate this subject some twenty years ago, since which period that Society has published records occupying some 350 pages of the *Journal*, as well as maps and diagrams. It is suggested that the whole subject shall be now reviewed by a fresh Conference, in order to consider whether the observations should be continued or otherwise. It was proposed that the Secretary should confer with the Secretary of the Meteorological Society on the matter.

NATIONAL CHRYSANTHEMUM.

October 24.—The Floral Committee of the above Society met at the Royal Aquarium on the above date, Mr. W. H. Fowler in the chair, and there was a large attendance of members.

A First-class Certificate of Merit was awarded to Japanese Reine d'Angleterre, rosy, or amaranth-purple, like a deep-coloured Etoile de Lyon, with broad, drooping florets, from Mr. W. J. Godfrey, nurseryman, Exmouth. In addition, Mr. Godfrey had Mons. C. Molin, which the committee wished to see again; Comtesse de Galbert, a pretty blush incurved Japanese; Florence Bond, deep silvery-pink, a pretty flower, but which does not come large enough for exhibition; Lady Kennaway, and Marchioness of Drogheda, golden-buff and apricot, darkening to salmon, which the committee wished to see again. First-class Certificates of Merit were also awarded to Carnations Reginald Godfrey and Miss Mary Godfrey, both from the same exhibitor.

Mons. E. Calvat, Grenoble, France, who has been successful in raising some very fine seedling Japanese, sent four varieties, to which First-class Certificates were awarded, viz., Robert Ballantine, purple-magenta, with broad, drooping florets, large and full, and extra-fine; to Mrs. H. J. Jones, a large incurving white Japanese of great promise; and Admiral Avellan, a large deep yellow variety, of excellent quality. Fleur Grenobloise, a delicate blush flower, was also shown. Mons. H. Fatzer, Quessy, France, sent a white sport from Mdlle. E. Rey, which the committee considered to be very promising, and recommended M. Fatzer to grow it another season, and exhibit it in a more developed character.

Mr. Wells, of the Earlswood Nurseries, Redhill, had a collection of new varieties he had exhibited the day previous at the meeting of the Royal Horticultural Society, but added Standard, of the type of Prefect Robert, but not so broad in the petal. Mr. Peters, gr. to H. P. Sturgis, Esq., Leatherhead, sent Miss Sturgis, a large Japanese variety in the way of Primrose League. Messrs. J. R. Pearson & Sons, Chilwell Nurseries, Notts, received a First-class Certificate of Merit for Sarah Hill, exhibited the previous day at the Drill Hall. Japanese

Hairy Wonder, from Mr. H. J. Jones, Lewisham, was unanimously awarded a First-class Certificate of Merit; and the same award was made to a Japanese Anemone-flowered, of a bright wine-coloured crimson hue. A First-class Certificate of Merit was awarded to reflexed Miss Florence Lunn, brighter and deeper coloured than Dr. Sharpe, highly promising; he also had Pallanza, a very fine deep yellow Japanese in the way of Sunshine, which was Commended; and Burgess Hill, a promising English incurved, the committee wished to see again. Japanese Prefect Robert was shown by Mr. T. L. Turk, Cholmeley Lodge Gardens, Highgate, and the blooms from the latter being the finest, a First-class Certificate of Merit was awarded. The same award was made to Miss Goschen, pure deep lemon-yellow, with large full flowers—a fine Japanese variety; from Mr. E. Beckett, Aldenham House Gardens, Elstree, who has Mrs. Norman Wrightson, a large pure yellow Japanese; Winnie Sweet, golden buff; and William Fyfe, soft lilac-pink, large, pleasing in colour, but a little flat as shown. A First-class Certificate of Merit was awarded to Mrs. E. S. Trafford, a sport from Japanese W. Tricker, of the colour of Sarah Owen, having a salmon-buff centre—a fine incurving variety, from Mr. W. H. Lees, The Gardens, Trent Park, Barnet. M. Auguste Lacvivier, from Messrs. H. Cannell & Sons, Swanley, was Commended.

WORCESTERSHIRE FRUIT SHOW AND CONFERENCE.

October 24, 25.—A very successful conference and show of hardy fruit, vegetables, Chrysanthemums, and dried and preserved fruits, was held in the Shire Hall, Worcester, on the above date, under the auspices of the County Council, and upon somewhat novel lines; for whereas prizes in cash were avoided, suitable awards in the shape of Silver Cups and Silver and Bronze Medals were made in accordance with the merits of the exhibits. These exhibits were arranged in specified classes, and open to the exhibitors residing in the county. Upwards of 700 dishes of fruit were placed in the large hall, with plants and flowers at either end.

The objects of the exhibition are the encouragement and development of hardy fruit cultivation, the furnishing of object-lessons in fruit-growing, and showing the capabilities of Worcestershire as a fruit-growing county. The arrangements for the show were carried out by a committee of the Worcestershire Union of Workmen's Clubs and Institutes, with Mr. E. C. Newmarch as hon. secretary.

Section 1, for thirty-six dishes of Apples and Pears, open to gentlemen's gardeners or others, brought an extraordinary display of large, clean, high-coloured fruits, and in a very marked degree showed the capability of the county to hold its own even with Kent. Much the best of it came from Madresfield Court, a place fortunately for some exhibitors, where showing for competition is prohibited. A Silver Cup of the value of £5 was awarded this fine collection. The best Apples were Peasgood's Nonsuch, Lord Derby, Tyler's Kernel, Cox's Pomona, Lady Henniker, Stone's, Blenheim Orange Pippin, Calville Malingre, Calville Rouge Précoce, and Barnack Beauty.

Pears.—Doyenné du Comice, very fine; Pitmaston Duchesse, Beurré Bachelier, B. Superfin, B. Hardy, Conference, Marie Louise, Glou Morçeau, &c.; Lord Hindlip was 2nd, and Sir E. Lechmere 3rd.

Section 2 was set apart for nurserymen, and Messrs. Rowe & Co. and Mr. J. H. White staged well, showing some fine Pitmaston Duchess, Doyenné du Comice, and other varieties of Pears, and were each awarded a Silver Medal. The Black Pear of Worcester, one of the city emblems, as well as Doyenné du Comice, Beurré Superfin, and Marie Louise, were shown well in Messrs. Rowe's collection.

The next two classes were for fruit farmers holding over 10 acres and under 10 acres, but the produce in these cases was poor and undersized, and almost devoid of colour.

Section 8 was for vegetables, and two of the most complete collections ever seen in the county were shown. A Silver Medal and a Special Commendation were awarded to that which came from Madresfield Court, everything in season being in best condition, reflecting much credit on Mr. Crump, the gardener. Dowager Lady Hindlip won the Bronze Medal.

The best packed basket of Grapes, not less than 12 lb. nett, brought out a good competition, but some were disqualified for not complying with the conditions of forwarding by public means of conveyance. Earl Beauchamp won the Silver Medal with a fine basket of Black Alicante Grapes packed with moss.

The Fruiterers' Company offered a Silver Medal for the best packed box, basket, or barrel for market, quality of fruit and economical method of packing to be considered, to be delivered at the exhibition by public means of conveyance. Mr. Crump was again to the front, with a splendidly-packed box, (60 lb.) of Pitmaston Duchess Pears, and another equally well-packed box of 60 lb. of Peasgood's Nonsuch Apples; each fruit was wrapped in pink tissue paper, and layers of wood-wool.

Messrs. G. Bunyard & Co., Maidstone, showed, not for competition, 200 dishes of very fine Apples and Pears; receiving a vote of thanks. In flowers, Lord Coventry exhibited a stand of stove and greenhouse plants with particularly fine foliage, and some yellow and white Chrysanthemums, remarkable for size and beauty. Canon Coventry also showed some good Chrysanthemums. The other exhibits in this class were principally by nurserymen.

The class for dried and preserved fruits was not well filled, this method of treatment not having made much progress locally. Mr. F. Ricardo, Ledbury, however, had a very interesting display of conserved fruits, herbs, and vegetables, including a large variety of dried Apples, which should cause considerably more interest to be taken in this method of dealing with fruit.

Papers were afterwards read at the Conference by Mr. Baillie, Chester; Mr. W. Crump, Madresfield; and Mr. Masters, Evesham. A good discussion followed.

SCOTLAND.

AUTUMN IN SUTHERLANDSHIRE.

The autumn of 1894 will be long-remembered in the North of Scotland as the finest experienced for at least a third of a century. I have carefully examined the meteorological records kept here since 1859, a period of thirty-five years, and can find no record of such a long spell of fine autumn weather such as we have enjoyed this year. We had a good deal of rain during the months of May, June, July, and the first three weeks of August. The reign of fine weather set in on August 23, and has continued to the present time (October 13) without a break, excepting a fine mild rain on October 9, which was much required; indeed, more would have been welcome, as only ·38 of an inch fell.

The total rainfall for September was only ·19, or a little under two-tenths of an inch, which fell in light showers on five days during the month, but without spoiling a day of the glorious weather during the month, the average rainfall for September at Dunrobin being 2·60 inches. From August 23 to October 13, a spell of seven weeks and three days, there has only been 0·65 of an inch of rainfall, mostly as light showers on ten days. The mean maximum for September was 56°·5; the mean minimum, 46°·4. Many of the days have been fine, clear, and sunny, with occasional dull mild days between, but all equally enjoyable.

The first half of October was a continuation of the weather of September, with a slight lowering of the temperature, though up to that there time had been no frost, and the flower gardens were nearly as bright then as in August. Heliotropes, Dahlias, Mignonette, Tropæolums, and similar tender plants were still flowering profusely. The absence of wind for the previous seven weeks was most remarkable. On very few days was there wind enough to open out the folds of a flag. The equinoctial gales, which almost invariably put in an appearance some time about the 18th to the 25th of September, this year made no sign. The barometer was steady and high, ranging between 30·10 and 30·60, falling below 30·00 no 29·96, on two days only during the seven weeks. Farmers for once, in the north at least, have had no room to grumble about the weather during harvest time. The grain was cut, matured, and gathered into the stack-yard almost without a shower.

We were fortunate here in escaping damage by spring frosts, at the glass only went down to 32° in the Stevenson screen on the night of the 19th of May, with a northerly wind and light shower of snow. Probably our proximity to the sea, and the shelter afforded by hills and woods, in taking the edge off north winds, accounts for our comparative immunity from the frosts which were so destructive in more southerly parts of the country. The rainfall in May, June, July, and the first half of August was over average, and in some districts the securing of the hay harvest was rather troublesome, though in most cases it was secured ultimately in fairly good condition. The wet suited most growing crops, and all kinds of fruits and vegetables have been plentiful and good. Onion and Carrot crops have been entirely free from grub and maggot. The Apple crop has been excellent; the fruit perhaps a little smaller than usual, owing to the heavy crop. Bees have had a good time, and are still adding to their winter store. We can scarcely hope for many more days of the fine weather; and the gradual lowering of the night temperature is a warning that we may have a taste of winter any time now with little notice. *D. Melville, Dunrobin Castle Gardens.*

PERTHSHIRE NOTES.

Orchid growers in the North are mostly familiar with the name of Sharpe, who is the cultivator in charge of the well-known gardens of Mr. Wood, a country proprietor very favourably known in Scotland as a patron of horticulture, and of Orchids in particular. These plants are grown extensively at Freelands, in the romantic parish of Forgandenny, with its ancient kirk placed in a weird position, and near the picturesque village. Freelands is well known in Scottish history as the home of the Ruthvens, who have left their name engraved on the page of time; but not in the felicitous manner in which Mr. Wood is doing at the present day in horticulture and arboriculture.

There is much that is ancient, and beautiful as well, in this fine domain which is wisely retained intact, notably fine avenues of lofty Beeches, Silver Firs of great height and girth; and Yews among the largest in the kingdom. Giant Larches and Coniferous trees of much later date are to be found throughout the grounds associated with choice shrubs.

The spacious mansion stands fronting a well-kept lawn, where bushes of Rhododendrons are conspicuous in the background, and hills of pleasant aspect form a grand bordering to the picture. It was the Orchids, however, which I was desirous of seeing, the choicest of which may often be found gracing the tables at the shows of the Royal Caledonian Society, for to see them at Freelands is much more interesting and instructive.

Passing with Mr. Sharpe into what we may call the show-house, a span-roofed structure, filled with plants in flower, or about to open their flowers, I observed more than ten dozen spikes of Odontoglossum Alexandræ on plants, some of which are of large size, but the greater number of middle size. The species O. Hallii, O. Pescatorei, and O. triumphans were well represented, and had fine long spikes of their handsome flowers.

Masdevallias were in fine form, and many open blooms were observable, especially of Harryana and "Bull's Blood." Epidendrums are well done in this house. In another division Odontoglossum vexillarium was making good progress under the cool treatment afforded. Oncidium aurosum and O. macranthum were in robust health, blooming freely. Odontoglossum polyxanthum and O. Uro-Skinneri were noticed among the choice species in this structure. O. pulchellum, O. cordatum, and O. nebulosum were flowering very freely, and they are much valued for their general usefulness in decoration. Platyclinis, Dendrochilum filiforme was growing vigorously in this house. Passing through stoves filled with popular flowering and foliage plants such as Dræcanas, Crotons, Eucharis, a pair of fine healthy plants of Vanda cœrulescens was remarked, which possessed fine spikes of flowers.

Strawberries and Tomatos were noted when passing to a large house filled with Vandas, Cattleyas,

Dendrobiums (some immense specimens), Cypripedium Lawrencianum, and C. Sanderianum, Cattleyas, Dendrobium densiflorum, Wardii, and nobile, and some Vandas were conspicuous for size and health, as well as were Cattleya labiata and C. Trianæi.

Some plants are grown specially for their usefulness as cut flowers. A plant of Dendrobium densiflorum over 6 feet across was prominent at the end of this house. Cœlogynes are grown in quantity, and much valued during the winter and spring for their flowers when cut. Cypripedium grande, C. ciliolare and others figured well in this house of valuable plants.

After spending a large portion of my time among the plants, the fruit houses could only be cursorily glanced at. Entering the range of vineries which runs along the northern side of a fruit garden, Hamburgh and Muscat Grapes were remarked; the crops being very heavy and regular, with strong growth in the four houses. In this department much progress has been made since a previous visit. In the Peach-houses healthy trees and good crops of fruit were remarked; Early Silver, Noblesse, Dymond and Barrington being the varieties which are in special favour, and among Nectarines, Lord Napier, Pine-apple, Violette Hâtive and Victoria predominate, and these varieties do remarkably well. In a Rose-house very floriferous plants of Souvenir d'un Ami, Niphetos, and Maréchal Neil were noted, where, trained in front and up the back wall, they afford a large quantity of flowers.

While in this locality, one could not resist the temptation to visit Rossie Gardens, where a most successful Chrysanthemum cultivator resides. Those who examined the 1st prize lot of thirty-six blooms at Edinburgh exhibition last November, which was looked upon as one of the finest ever seen in the North, may understand that Mr. Nicol is a first-rate cultivator; and it is more than likely that this enthusiastic but very retiring exhibitor will have even higher honours than last year. His plants are at present as promising as they can be. A fine range of glass has just been erected by McKenzie & Moncur, for plant and fruit-growing. Vines are already of great strength, almost erring, indeed, on the side of vigour! This is one of the oldest gardens in Perthshire, and coming rapidly to the front. *M. Temple, Carron House, N.B.*

FOREST DESTRUCTION IN AMERICA.

But a few weeks have elapsed since the world was startled by descriptions, per cable, of wide-spread devastating fires in the great Pine forests of the North-western United States, including also many towns and the inhabitants thereof. The statistics ventured upon by the American newspaper agencies as to loss of life and property, were so startling, that it seemed only right that some inquiry should be made into the matter, and this by the fountain-head in Washington, viz., the Department of Forestry, affiliated to that of Agriculture, dominated by Mr. J. S. Morton. Of course, there was no delay on the part of the Secretary of the Forestry Department, and this is what he wrote under date of September 26:—"This Department is not in a position to ascertain more correctly the loss than the various State agencies and interested parties; and it will take quite a long time before any approach to correct statements will be reached. The newspaper accounts may in general be considered exaggerations, and considerable discounts must be made from their statements as to loss of life and property. The present disaster, however, has been most unusual in extent and amount of damage, and especially in loss of life. From good sources, it would appear that the latter may be placed at a round thousand people. The estimates in loss of timber are beginning to be reduced by later reports, sometimes to one-half the original estimate. The various lumber operators and timberland owners have now their agents in the woods to ascertain the damage, and to learn what quantities must be felled in order to prevent total loss from insect pests following such fires. In addition to these losses, which can be estimated, there are, of course, enormous incalculable losses in the devastation of timberlands, which, are of such usual occurrence every year on so vast a territory, so thinly settled, that no account is taken of them. The agitation for measures to prevent the occurrence of such disasters is now thoroughly aroused, and we hope the beneficial result a more efficient protection in the future."

To this last sentence we heartily say "Amen," in the hope that the measures taken will be sufficient to give confidence to settlers in timberlands, even so early as during the advent of the summer of next year.

KEW NOTES.

Fagræa zeylanica.—There is a large specimen of this Ceylon shrub now in flower in the Victoria-house at Kew. It does not flower often, the last occasion being in June, 1888. It grows so freely, that it would soon fill a house if left to itself. The branches are somewhat succulent, the leaves obovate-oblong, 10 inches by 4 inches, fleshy, and not unlike the leaves of Griselinia. The flowers, which are in short terminal corymbs, are trumpet-shaped, not unlike those of Lilium longiflorum, but smaller, the tube being 4 inches long, and the reflexed lobes 2 inches by 1 inch; they are fleshy and creamy-white. The genus is related to Buddleia, and there are some thirty species, all natives of the Old World tropics.

Carex "japonica" = C. brunnea.

Carex japonica is a name that has been given to several distinct species which have been introduced into our gardens at various times from Japan. One of these is the erect, linear, dark green-leaved plant figured in the *Gardeners' Chronicle*, and grown largely by market growers for decorative work. Four years ago this plant was thought to be C. tristachya, but it has lately been determined by Mr. C. B. Clarke, P.L.S., our first authority on this most difficult genus, to be C. brunnea of Thunberg, native of Japan, India, &c. Another name for it is C. gracilis of Robert Brown. (See *Revue Horticole*, 1892, p. 384.) A variegated variety of C. brunnea is in cultivation under the name of C. japonica variegata and C. tenuis variegata. It differs from the type only in having a narrow band of creamy-yellow on the edges of the leaf.

Another plant known in gardens as C. japonica is C. Morrowii of Boott. It has shorter and much broader leaves than C. brunnea, and is represented in cultivation by a variegated form. It is cultivated by the Glasgow nurserymen, and makes a pretty little pot-plant. It is hardy at Kew, but not at all attractive when grown in the open ground. These three plants may be seen correctly named in the No. 4 conservatory.

Still another plant, with linear, recurved, variegated leaves, densely tufted, and deciduous in winter, is called C. japonica in gardens, but it is certainly not that species, although as it has not flowered it cannot be determined. The true C. japonica does not appear to be in gardens here. There are about 300 species of Carex in Japan! *W. W., Kew.*

TRADE NOTICE.

We are informed by Messrs. W. L. Lewis & Co., Southgate, that Mr. George Booker, hitherto serving as Orchid-grower in their establishment, will in future re present them as traveller.

ENQUIRY.

"He that questioneth much shall learn much."—Bacon.

Mr. John Maehns would be much obliged if any of our correspondents could inform him of the whereabouts of John Peiver, who in 1870 was Foreman (or had been Foreman), to Mr. E. Spivey, in the gardens at Hillingbury Place, Bishop's Stortford?

MARKETS.

COVENT GARDEN, November 1.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

Potatos.

The market is being kept rather short of supplies by farmers who are now busy with other work on the land while favourable weather continues. Prices in consequence have made slight advances in most cases. Best kinds, good samples, 85*s.* to 100*s.*; ordinary samples and blacklands, 55*s.* to 70*s.* *J. B. Thomas.*

SEEDS.

London: *October* 31.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market bare of buyers. Clover seeds generally show no important change. The remarkably low rates current for Alsyke, attract increasing attention to the article. For Winter Tares there is a diminishing inquiry. Seed Rye is also neglected. Rye-grasses are drooping. The sale for Bird seeds is small. Haricots are strong at the late rise. Blue Peas keep steady. New English Mustard and Rape seed continue exceedingly cheap. Higher prices are asked for Scarlet Runner Beans. Linseed is dull. Fine French Buckwheat can now be bought on very tempting terms.

FRUITS AND VEGETABLES.

Borough and Spitalfields: *October* 30.—Quotations:—Cabbages, 1*s.* 6*d.* to 3*s.*; Savoys, 2*s.* to 4*s.*; Cauliflowers, 1*s.* 6*d.* to 2*s.* 6*d.* per tally; Carrots, 1*s.* to 2*s.*; Parsley, 9*d.* to 1*s.*; Turnips, 1*s.* to 2*s.* per dozen bunches; Horseradish, 1*s.* to 1*s.* 6*d.* per bundle; Onions, foreign, 2*s.* to 2*s.* 6*d.* per bag; do., English, 3*s.* 6*d.* to 4*s.* per cwt.; Apples, 2*s.* to 8*s.* per bushel; Pears, 1*s.* 3*d.* to 3*s.* per half bushel.

Stratford: *October* 30.—The market has been well supplied with every description of produce during the past week, and, with a good attendance of buyers, a brisk trade was done at the prices mentioned below:—Cabbages, 1*s.* 6*d.* to 2*s.* 6*d.* per tally; Savoys, 1*s.* 6*d.* to 3*s.* do.; Greens, 3*s.* to 5*s.* do.; Cauliflowers, 6*d.* to 1*s.* per dozen; do., 2*s.* to 5*s.* per

tally; Celery, 7*d.* to 1*s.* per roll; Horseradish, 1*s.* to1*s.* 3*d.* per bundle; Brussel Sprouts, 1*s.* 6*d.* per to 2*s.* flat; Turnips, 1*s.* 6*d.* to 2*s.* 3*d.* per dozen bunches; ditto, 25*s.* to 40*s.* per ton; Carrots, household, 22*s.* 6*d.* to 30*s.* per ton; ditto, cattle-feeding, 18*s.* to 25*s.* do.; Parsnips, 6*d.* to 10*d.* per score; Mangels, 12*s.* to 17*s.* per ton; Swedes, 15*s.* to 20*s.* per ton; Onions, English, 60*s.* to 75*s.* per ton; do., Dutch, 2*s.* to 2*s.* 6*d.* per bag; do., Valencias, 6*s.* to 6*s.* 6*d.* per case; Apples, English, 2*s.* to 6*s.* per bushel.

FARRINGDON: *November* 1.—Quotations: Cabbages, 5*d.* to 6*d.* per dozen; do. pickling, 1*s.* to 1*s.* 6*d.* do.; Cauliflowers, 10*d.* to 1*s.* do.; Spinach, 1*s.* per bushel; Sprouts, 1*s.* 3*d.* to 1*s.* 6*d.* per half bushel; Parsnips, 9*d.* per dozen, 3*s.* per cwt.; Beetroots, 9*d.* per dozen; Carrots, 2*s.* 6*d.* per dozen bunches; Turnips, 2*s.* per dozen bunches; Onions, English, 4*s.* per cwt.; do., 6*s.* per case; Horseradish, 1*s.* 4*d.* per bundle; Celery, 1*s.* per dozen; Apples, cooking, 5*s.* to 6*s.* per bushel; do., dessert, 6*s.* to 7*s.* do.; Pears, 2*s.* to 8*s.* do.; Tomatos, 6*s.* per doz. lb.; Grapes, English, 1*s.* to 1*s* 4*d.* per lb.; Walnuts, 8*s.* per bag; Blackberries, 2*s.* per basket (= 2*d.* per lb.)

POTATOS.

BOROUGH AND SPITALFIELDS: *October* 30.—Quotations ranged from 50*s.* to 95*s.* per ton.

STRATFORD: *October* 30.—Quotations: — Magnums, Dark-soil, 55*s.* to 60*s.* do.; Light-soil, 60*s.* to 70*s.*; Bruces, 60*s.* to 70*s.*; Imperators, 55*s.* to 80*s.*; Main Crop Kidneys, 60*s.* to 75*s.*; Scotch Main Crop, 75*s.* to 85*s.* per ton.

FARRINGDON: *Novembsr* 1.—Quotations:—Snowdrops, 80*s.* to 90*s.*; Main Crop, 80*s.* to 100*s.*; Magnums, 65*s.* to 85*s.*; Hebrons, 75*s.* to 90*s.*; Regents, 65*s.* to 75*s.*; Champions, 60*s.* to 70*s.*; Kidneys, 60*s.* to 75*s.*; Early Rose, 60*s.* to 70*s.*; Black Lands, 55*s.* to 65*s.* per ton.

CORN.

Averages.— Official statement of the average prices of British Corn, imperial measure (qr.), for the week ending October 27, and for the corresponding period last year:—
1894: Wheat, 17*s.* 7*d.*; Barley, 23*s.* 8*d.*; Oats, 13*s.* 3*d.*
1893: Wheat, 27*s.* 6*d.*; Barley, 29*s.* 6*d.*; Oats, 18*s.* 2*d.*

HAY.

Averages.—The following are the averages of the prices at the principal metropolitan markets during the past week:—Clover, prime, 75*s.* to 132*s.*; do., inferior, 45*s.* to 120*s.*; hay, best, 80*s.* to 120*s.*; do., specially picked, 130*s.*; do., inferior, 36*s.* to 60*s.*; Mixture, 90*s.* to 120*s.*; and Straw, 22*s.* to 38*s.* per load.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Districts.	Temperature. Above (+) or below (—) the Mean for the week ending October 27.	Temperature. Accumulated. Above 42°, for the Week.	Below 42°, for the Week.	Above 42°, difference from Mean since January 1, 1894.	Below 42°, difference from Mean since January 1, 1894.	Rainfall. More (+) or less (—) than Mean for the Week.	No. of Rainy Days since Jan. 1, 1894.	Total Fall since Jan. 1, 1894.	Bright Sun. Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 1, 1894.

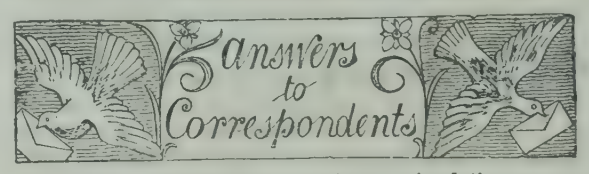
The districts indicated by number in the first column are the following:—

0, Scotland, N. *Principal Wheat-producing Districts*—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. *Principal Grazing, &c., Districts*—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.



THE following summary record of the weather throughout the British Islands for the week ending October 27, is furnished from the Meteorological Office:—

"The *weather* during this week gradually became extremely unsettled and rainy in almost all parts of the Kingdom. The rainfall was unusually heavy over Ireland, England, and the more south-western parts of Scotland. Thunderstorms and a good deal of lightning occurred at several of our more southern stations during the middle or latter part of the week.

"The *temperature* continued below the mean in 'Scotland,' and the northern districts of 'England and Ireland,' but was rather above the normal in most other parts of the Kingdom. The highest of the maxima (which were recorded between the 24th and 26th) ranged from 63° in 'England, S. and the Channel Islands,' to 56° in 'Scotland, N.' The lowest of the minima were registered either on the 22nd or 23rd, when the thermometer fell to 18° in 'Scotland, E.' (at Braemar), to 21° in 'Ireland, N.,' 22° in the 'Midland Counties,' and to between 24° and 31° in all other districts, except the 'Channel Islands,' where the lowest reading was 45°.

"The *rainfall* just equalled the mean in 'Scotland, N.,' but exceeded it in all other districts, the excess being very large, except in 'Scotland, E. and England, E.' The largest amounts recorded during the week at any individual stations were 4·49 ins. at Killarney, 4·46 ins. at Westbourne (Sussex), and 4·28 ins. at Holyhead. At Westbourne on Wednesday, as much as 2·09 ins. fell between 8 A.M. and noon.

"The *bright sunshine* exceeded the mean value at most of the 'Scotch' stations, and just equalled it in 'England, E.;' elsewhere there was a general deficit. The percentage of the possible amount of duration ranged from 35 in 'Scotland, E.,' and 32 in 'Scotland, N.,' to 18 in 'England, N.W.,' and to 14 in 'England, N.E.'"

**** *Owing to the large increase in our circulation, we are reluctantly under the necessity of going to press some hours earlier. Our contributors, who well know what this implies, will kindly aid us by sending their communications as early in the week as possible. Communications should reach us not later than Wednesday.*

**** PLANTS, FRUITS, ETC., TO BE NAMED.—*Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be good ones, carefully packed and numbered, and not more than six varieties should be sent at one time. Leaves only, or Florists' varieties cannot, as a rule, be named.*

BEGONIA LEAVES: *F. G. G.* Bacteria and fungi are entirely absent from the Begonia leaves. The conditions are due to some errors in treatment, probably imperfect ventilation.

BOOKS: *Young Gardener. The Art and Practice of Landscape Gardening*, by Henry E. Milner, published by Simpkin, Marshall, Hamilton, Kent & Co., Stationers' Hall Court, London.

CORRECTION.—Mr. Geo. Stevens received an Award of Merit at the last meeting of the Royal Horticultural Society for Japanese incurved Chrysanmum Prefect Roberts, not President Borel.

DATE OF DEATH OF J. WILLIAMS: *E. H.* On Christmas Eve, 1891; see *Gardeners' Chronicle*, Jan. 2, 1892, for notice of the same; and for his portrait the following week.

FRUIT ROOM UNDERGROUND: *J. B. T.* The position of the room and its depth below the surface should make it an admirable place for keeping Apples and Pears. The walls should be hollow by preference—that is, built of two walls, 4½ inches in thickness, with a 4½-inch space between them, and be connected by bonding bricks, the outer wall being set in cement, so as to exclude moisture. The floor may consist of beaten clay, gravel, or tiles, and the roof of straw or reed-thatch 1 foot in thickness, finishing off with good overhanging eaves, that will throw off the water to some distance from the walls. In lieu of guttering, make a runlet round the walls of small pebbles, laid in hydraulic mortar or cement. If it be span-roofed, there might be a door at each end with a swinging light over each, to admit of well-ventilating the place whilst the fruit is sweating. With a thatched hurdle placed against the doors, such a fruit-room is safe from frost of any severity. If you have much fruit to be stored, shelves are indispensable, otherwise an earthen bench, with retaining walls of brick, would answer very well. If shelves must be put up, do not use deal; and give the shelves a slight slope towards the front.

FUNGUS ON BEECH TREES: *A. C. F.* Specimen this time with the gills eaten away by insects, but it looks like Agaricus (Ærmillaria) mucidus, which is a saprophyte. I never saw it on living trunks. Fomes annosus is the old Polyporus annosus of Fries, and I think called Trametes radiciperda. Some affirm that the latter is different from annosus, although the difference cannot be distinguished by the naked eye. *M. C. Cooke.*

GRAPES: *W. S.* Your bunches of Mrs. Pince, judging by the very unripe state of the berries sent, will not mature. They are also "shanked," and you must look to the roots. See answer to "G. C. B." last week, and some others in recent numbers of the *Gardeners' Chronicle.*

GROWTH ON MARÉCHAL NIEL ROSE: *D. D.* The growth in question is common on this variety of Rose, and is often attributed to the action of frost. We suspect, however, that a slime fungus is also present. We will examine, and let you know.

FINGER-AND-TOE ON TURNIPS: *W. R.* Probably not; the spores of the fungus are in the soil.

INSECTS AND STRAWBERRIES: *R. K.* Cockchafer grubs in the second year of development, a stage at which they are capable of causing much injury to the roots of plants. It is very probable that your three-year old Strawberry plants which almost failed may have suffered from these grubs, as you say that at the root of almost every plant two or three were to be found. Dig the land, and leave it exposed to the weather and the attention of the birds. If a pig or two could be penned on the land, a clearance of the grubs would soon be made.

MANURE FOR BOWLING-GREEN: *F. W. R.* Neither of those manures that you mention in your note, unless they are in a very rotten state, and at once available as plant-food, are suitable. The object being the securing of a regular fine sward free from coarse grasses, it would be better to mix rotten manure, wood-ashes, and loam together, pass it through a ½-inch screen or sieve, and apply the mixture to the lawn twice or thrice during the winter.

NAMES OF FRUITS: *J. J. W.* 1, Beurré Bosc; 2, Vicar of Winkfield; 3, Bellisime d'Hiver; 4, Belle de Bruxelles; 5, Beurré Diel; 6, Van Mons Leon le Clerc.—*Hon.* 2, Grange's Pearmain; 3, Vicar of Winkfield; 4, Beurré Superfin; 5, Pitmaston Duchess; 6, not known.—*W. Parker.* 1, Beurré Hardy; 4, Figue d'Alençon; 8, Gansel's Bergamot; 28, Duchesse d'Angoulême; 35, Beurré Superfin; 43, Beurré d'Anjou; 68, rotten.—*R. Garret.* Pear, 1, Brown Beurré; 2, Urbaniste; Apple Hollandbury.—*Rev. G. H. Engleheart.* 1, Vicar of Winkfield; 2, Beurré Diel; 3, Beurré Rance.—*W. Wadsworth.* 2, Beurré Diel; 3, Duchesse d'Angoulême; 4, rotten White Doyenné; 5, Doyenné du Comice; 6, a small Uvedale's St. Germain.—*E. D.* 1, Comte de Lamy; 3, Comte de Flandres; 4, Triomphe de Jodoigne; 2, not known; 1, worthless.—*F. W. S.* 1, Duchesse d'Angoulême; 2, Bergamotte Esperen; 3, Emille d'Heyst; 4, Beurré Diel.—*D. D.* 1, Glout Morçeau; 2, Beurré Diel; 3, Verulam.—*H. Horsefield.* 1, Blenheim Orange; 2, Lord Derby; 3, Grange's Pearmain; 4, Forge; 5, Not known.—*Carter, Page & Co.* 1, Red Autumn Calville; 2, Lord Grosvenor?; 3, Bedfordshire Foundling; 4, Hubbardstone Nonsuch.—*J. M. Ritchie.* 1, Rymer; 2, Dutch Codlin; 3, Old English Codlin; 4, Cambusnethan; 6, Manks' Codlin; 8, Cox's Orange Pippin; 7, 9, Worcester Pearmain; 10, Pear Josephine de Malines—one Pear rotten.

NAMES OF PLANTS: *Chepstow.* 1, Cymbidium pendulum; 2, Cymbidium Mastersii; 3, Cypripedium barbatum; 4, Oncidium sp., send flowers; 5, Pellionia pulchra; 6, Fittonia argyroneura; 7, Not found; 8, Acalypha Macfeeana; 9, Duranta variegata.—*T. W. R.* The Acer is a form of the Japanese A. palmatum. The material sent is not sufficient to make out the Cratægus and Birch?—*W. P. B.* Cotoneaster affinis.—*R. P.* Cratægus Aronia. It may have been grafted on a

common Thorn, but can scarcely be a sport from it. —*Constant Reader, Aboyne, N.B.* Euonymus europæus (Spindle Tree).—*Sedum, Tunbridge Wells.* The Sedum is the white form of Sedum spurium. —*Zero.* Francisca calycina major (syn. Brunsfelsia).—*W. J. P., Farnham.* 1, Berberis Darwinii; 2, Berberis Wallichii; 3, Hypericum Androsæmum; 4, Elæagnus japonica aureo-variegata; 5, Spiræa (send when in flower); 6, Cotoneaster microphylla.—*G. N., Swansea.* 1, Send flowers; 2, Send in flower; 3, Habrothamnus (Cestrum) Newellii; 4, Acacia armata; 5, Aralia Chabrieri of gardens; 6, Adiantum hispidulum; the Phœnix is attacked by fungus peculiar to Palms.—*J. C.* 1, Aster Amellus; 2, A. diffusus horizontalis; 3, A. vimineus.—*W. Ogg.* 1, The Claret Vine; 2, Thuya gigantea (Lobbi of gardens); 3, Piptanthus nepalensis; 4, Hypericum calycinum; 5, Schizostylis coccinea; 6, Pernettya mucronata; 7, Libonia floribunda.—*B. G.* Schizostylis coccinea.—*G. T.* Rhus toxicodendron, very poisonous.

Palm Leaves: *G. N.* The spots on the leaves are caused by a fungus called Graphiola phœnicis. They have nothing whatever to do with spores of Gymnogramma.

Portugal Laurel: *H. C.* The silver leaf disease common in Laurels, Peaches, Plums, &c. The cause is not known. We should cut the plants back, and give a good dressing of manure. We fear, however, that but little can be done.

Salesman: *W. B.* We cannot advise you on such a question.

Tea Plants in Bad Health: *Thea.* At this season but little can be done to better their condition beyond putting the drainage in the pots in good order, picking out some of the old surface-soil, and surfacing them with a sandy mixture of loam two-thirds, leaf-mould one-third, and keeping them in a light, well-aired part of the greenhouse. The soil should be kept moderately moist—in fact, afford it the kind of treatment which would suit Camellia japonica. In March the plants should have much of the old soil removed, decayed roots cut back to sound tissue, and repotted in rather small pots, using the same kind of soil above-named, with the addition of a small quantity of peat. A temperature of 50° to 55° by night, and 65° to 70° by day should then be afforded them, and a syringing with clean water twice daily—i.e., from 7 to 8 A.M., and at closing time, 2 30 P.M. Summer treatment, when quite recovered from ill-health, may be similar to that given the Camellia.

To Keep Ampelopsis Leaves in a Fit State for Table Decoration: *Table Work.* The colours would be preserved in fairly good condition by pressing them between sheets of herbarium-paper, changing the paper thrice and keeping them under pressure. Another way would be to place them between layers of perfectly dry silver-sand in wide-mouthed jars or boxes. Passing a hot iron over them when placed between sheets of blotting-paper preserve the colours of some kinds of leaves very effectually; you might try this method with a few. There is no book that we know of now in print on the subject named. Try at the *Bazaar* office, 170, Strand, London, W.C.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENERS' CHRONICLE."

Important to Advertisers.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

Increased to the extent of 80 per cent., and that it is increasing weekly.

Advertisers are reminded that the "Chronicle" circulates among country gentlemen, and all classes of gardeners and garden-lovers *at home, that it has a specially large* foreign and colonial circulation, *and that it is preserved for reference in all the principal Libraries.*

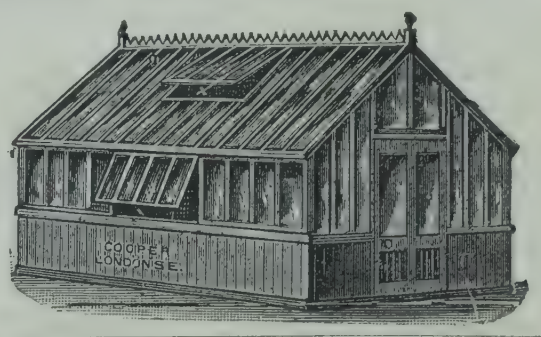
JAMES T. ANDERSON,

135 & 137, COMMERCIAL ST., LONDON, E.

£5000 TO BE GIVEN AWAY!

As an experiment and advertisement, we have decided to spend the above amount in erecting complete during the next month any size or style of house as below, in any part of England, at the ridiculously low prices mentioned.

CONDITIONS OF SALE.



1. All orders to be sent in before November 8, 1894, after which date no order will be booked below list prices.
2. Half the cash to accompany all orders, the balance to be paid to our foreman in charge of job upon completing erection, and prices to be strictly Nett.
3. All houses will be complete as mentioned below, and painted two coats of good oil-colour at our works, and delivered free of any charge to your nearest station.
4. Customers to advise us immediately upon arrival of goods at their station by telegram, and to cart same from station on to site, ready for erection, at their own expense, within 24 hours after arrival.
5. Customers to have all ground cleared and level for our men to erect.
6. Our men erect and glaze house complete ready for use. We pay all railway fares, lodging, &c.
7. We do not bind ourselves to erect on any particular date, which must be left entirely to us; but shall not exceed one month after date of arrival.
8. We reserve to ourselves the right to refuse any order or orders that may be sent in upon these terms.

N.B.—Prices quoted for heating-apparatus are only on condition that we supply the house as well; on no account could we deliver and fix heating-apparatus at these prices without order for house, although we are prepared to fix houses without heating-apparatus.

AMATEUR SPAN-ROOF GREENHOUSE.

(TENANT'S FIXTURE.)

This Greenhouse is made especially for Amateurs at a nominal figure, thereby coming within the reach of those who require a strong but not expensive structure, and being constructed in complete sections. The framework is substantially constructed of red deal, the lower part being filled in with good, sound, well-seasoned, tongued, and grooved matchboards. The House is fitted with door, complete with rim lock and brass furniture, painted two coats of good oil-colour, supplied with all necessary ironwork and stages for each side, and good 16-oz. English-cut glass throughout. Carefully packed and delivered carriage paid to nearest station, and erected complete, at the following respective prices:—

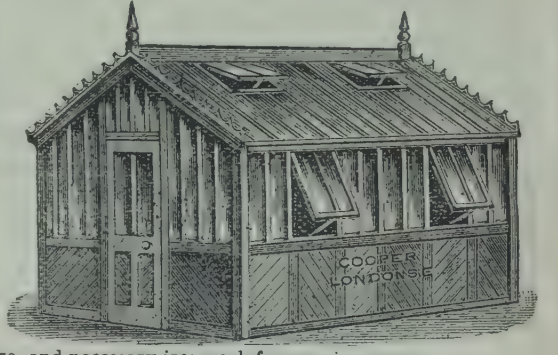
THE AMATEUR FORCING-HOUSE.

TENANT'S FIXTURE.—SPAN-ROOF.

These Houses are offered at an exceedingly low rate, and should be readily approved by both amateur and professional gardeners, as brickwork, which is very expensive to a small house, is entirely dispensed with.

The utility of such a House for forcing or cultivating Cucumbers, Tomatos, Melons, &c., will be perceived at a glance; it being a structure constantly in request but almost hitherto unknown.



SPECIFICATION.—Framework substantially constructed of red deal; the whole of sides, and 2 ft. 6 in. of ends, boarded with well-seasoned tongued and grooved matchboards. Half-glass door, complete with rim lock and brass fittings, on one end; glass 16-oz. throughout, English cut. Ventilators supplied, according to size of House, and stays necessary for opening same; stages for plants each side of House. All woodwork painted two coats of good oil-paint, and the whole structure securely packed and delivered carriage paid to nearest station, and erected and glazed complete, at the following respective prices:—

Length. ft.	Width. ft.	Height. ft. in.	£ s. d.	Length. ft.	Width. ft.	Height. ft. in.	£ s. d.

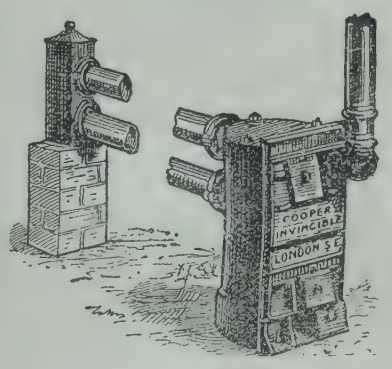
12	8	8 0	7 10 0	100	10	9 0	65 0 0

SPAN-ROOF VILLA CONSERVATORY.



This House is adaptable for the lawn of a villa-residence, being well and substantially built, constructed of the best materials, and artistically finished, with diagonal panels. The framework is composed of 2 in. by 3½ in. red deal, the lower part doubly-lined with tongued and grooved matchboards, the roof properly fitted with sashes which facilitates fixing or removing of same without disturbing glass.

The House is fitted with a half-glass door, complete with rim lock, brass fittings, and key, and is supplied with lattice-staging for each side, footpath the entire length of House; gutters, down-pipes, top and side ventilators, according to size, and necessary ironwork for opening same.

All woodwork painted two coats of good oil-paint, English-cut glass, and all parts securely packed and delivered carriage paid to nearest station, and erected complete, at the following respective prices:—

Long. ft.	Wide. ft.	High. ft. in.	To eaves. ft. in.	£ s. d.	Long. ft.	Wide. ft.	High. ft. in.	To eaves. ft. in.	£ s. d.

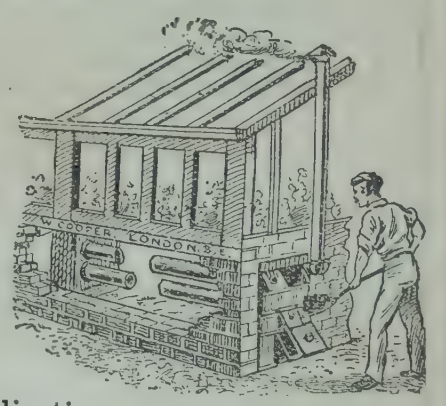
"INVINCIBLE" HOT-WATER APPARATUS.



MOST EFFICIENT AND CHEAPEST IN EXISTENCE.

TENANT'S FIXTURE.

Requires no sunk stokehole, and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. A child can stoke it. Success guaranteed.

COST of COMPLETE HEATING APPARATUS, Fixed Complete.

Size of Greenhouse. Outside measure.	With two rows of 4-in. pipes along one side of house. £ s. d.	Two rows 4-in. along one side and end of house. £ s. d.	Two rows 4-in. pipes along two sides and one end of house. £ s. d.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,
Will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kinds of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.
A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

Nov. 3, 1894.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

GARDENER (Head), and ORCHID GROWER.—Age 33, married, one child. Advertiser is open to re-engagement with any Lady or Gentleman. First-class testimonials from present and previous employers. Leaving through breaking-up of establishment.—JOSEPH MILBURN, Hoyland Hall, Barnsley.

GARDENER (Head).—Scotch; wishes situation in England, where three or four are kept. Eleven years in last situation. Can be well recommended.— W. GREEN, 13, Arthur Street, Pilrig, Edinburgh.

GARDENER (Head), Scotch.—Twenty years' experience leading places. Nine years Gardener to Cluny Macpherson, Cluny Castle, Kingussie, Scotland. Highly recommended.—ROBERT RITCHIE, East End, Kingussie, Scotland.

GARDENER (Head).—Age 38, married, two children, both out. Mr. PERCY BUNYARD can thoroughly recommend a good all-round man as above. Undeniable character.—52, Clarendon Road, Croydon.

£2 BONUS to anyone securing for me a situation as GARDENER (Head or Second). Life experience in the general routine of Gardening, Inside and Out. Excellent characters from last three places. Abstainer. Age 27, single; disengaged.—E. COLLINS, Sarratt, Rickmansworth, Herts.

GARDENER (Head, or Foreman).—Age 34; Churchman, married, no family. Highest references. At liberty when suited. Moderate wages.—GARDENER, Parsonage, West Farleigh, Maidstone.

GARDENER (Head Working).—Age 33; highly recommended. Life experience. Thoroughly energetic, trustworthy, and efficient in all branches. Excellent testimonials. — A. CORDERY, Ceylon Villas, Southampton Road, Fareham, Hants.

GARDENER (Head Working).—Age 37, married, no family; life experience in good places. Can be highly recommended. Excels in Fruit, Orchids, Roses, Chrysanthemums, and good all-round man. — GARDENER, Higham, Windlesham, Surrey.

GARDENER (Head Working); age 30.—J. DAY, Gardener to the Earl of Galloway, Galloway House, Garliestown, would be pleased to recommend William Norman, who has been General Foreman in these Gardens for nearly four years, to any Lady or Gentleman requiring the services of a good, practical man, where three or more are employed; fourteen years' experience in leading places in England and Scotland.

GARDENER (Head Working).—Age 40; life experience in all branches of gardening; well recommended by last and previous employers; wife undertakes small dairy or poultry.—Mr. J. HORN, 56, Croydon Grove, West Croydon.

GARDENER (Head Working).—Age 37, married, no family; good practical experience in all branches. Two years' excellent character. Gentleman going away.—E. CROCKFORD, The Grange, Bistree, Herts.

GARDENER (Head Working). — G. WILLIAMS, Esq., Fingest House, Henley-on-Thames, late of Lower Wyke Lodge, Worcester, can with confidence recommend his Gardener to any Lady or Gentleman. Thoroughly understands his work.—ALFORD, Lower Wyke Lodge, Worcester.

GARDENER (Head Working); age 32; married. — Mr. WM. ELPHINSTONE, Shipley Hall Gardens, Derby, can with confidence recommend George Marlow, who has acquired a first-class general knowledge, including Orchids in leading Gardening establishments in this country and on the Continent.

GARDENER (Head Working).—Age 30. J. H. AYLING, General Foreman for the last three years at Londesboro' Park, is desirous of obtaining a situation as above. Thoroughly versed in all departments. Well recommended.—Londesboro Park, Market Weighton, Yorkshire.

GARDENER (Head, or Single-handed).—Age 37, married; thoroughly experienced with Grapes, Peaches, Cucumbers, Tomatos, Flowers, and Vegetables of all kinds. Good character.—SHEPHERD, Dragon Street, Petersfield, Hants.

GARDENER (Head, or good Single-handed).—Age 27, married; well up in the culture of Vines, Peaches, Melons, and Tomatos; also Stove and Greenhouse Plants. Can be well recommended by present employer. —JAMES McEWAN, The Gardens, Pitcullen House, Perth.

GARDENER (Head, or good Single-handed).—Age 30, married, one child; good practical experience in Vines, Greenhouse Plants, Flower and Kitchen Gardens. Excellent characters from good families. Disengaged.—HORTUS, 91, Wykeham Road, Reading.

GARDENER (Single-handed or Under).—No objection to bothy. Six and a half years' good character; age 23; single.—G. M., 12, Cobden Road, Sevenoaks, Kent.

GARDENER (Single-handed, or Second). —Age 29, single; Glass, Kitchen, and Flower Garden. Excellent character; willing to be useful. — A. BISHOP, 3, Hamilton Road, West Norwood.

GARDENER (Single-handed or otherwise). —Age 25; good all-round hand. Ten years' excellent character.—F. WELLS, 6, Clyde Terrace, Forest Hill, S.E.

GARDENER (good Single-handed, or where help is given).—Age 26, single; life experience Inside and Out. Four years' last place. Well recommended. —W. THORN, 4, Park Road, Bushey, Herts.

GARDENER (Second, or good Single-handed.)—Age 23; married, Eight years' experience, Inside and Out. Good character.—GEORGE BUDD, Woodman's Farm, Bishop's Waltham, Hants.

GARDENER (Kitchen, or Single-handed), or GARDENER and CARETAKER.—Age 28, married, no family. Well-up in the general routine of work. Good references.—W. MITCHELL, Jetty Lane, Woodbridge, Suffolk.

GARDENER (Second), where three or four are kept.—Age 23; seven years' experience Inside and Out. Good references.—F. DOUCH, Park Gardens, Winchcomb, Glos.

GARDENER (Second).—Age 28; single. Thirteen years' experience Inside and Out. Oxford or Bucks preferred, also Rooms.—JOHN GALE, The Square, Marsh Gibbon, near Bicester, Oxon.

GARDENER (Second).—Well up in general routine of Gardening, Inside and Out; six years in present situation; good character.—C. LANE, The Gardens, Burntwood, Caterham, Surrey.

GARDENER (Second), where five or six are kept —J. S. UPEX, Wigganthorpe, York, wishes to recommend a young man, age 24, as above. Four years in present situation.

GARDENER (Under).—Age 18; Outside, and assist in Houses when required; six and a-half years in present situation; good character.—C. CRAMP, Bell Lane, Staplehurst, Kent.

GARDENER (Under), where five or six are kept.—Age 24; can be well recommended by last and previous employers, used to Houses and general work; understands Bees. Abstainer.—W. LEECH, Long Stratton, Norfolk.

GARDENER (Under), Outside.—Age 17; strong and obliging.—GEO. KEMP, The Gardens, Missenden Abbey, can recommend a young man as above.

GARDENER (Under), Inside, or Inside and Out.—Young man (age 20). Six years' good character. —W. OUTRED, Church Street, Southfleet, near Gravesend, Kent.

GARDENER (Under).—Age 21; experienced Inside and Out. Can be well recommended by present employer; leaving through place being sold. Good references. —T. SHEARMAN, Mrs. Burtt, The Brows, Malton.

PENNELL AND SONS, The Nurseries, Lincoln, can recommend a good PROPAGATOR of all Hard and Soft-wooded Stuff.

To Nurserymen and Florists.

FOREMAN GROWER. — Age 28. Good knowledge of London Cut-flower Trade, Bulbs, Lilies, &c. Good references.—B. A., 41, Wellington St., Strand, W.C.

FOREMAN, in small Market Nursery.—Thoroughly understands Tomatos, Cucumbers, Peaches, Strawberries, Cut Flowers, Ferns, &c. Married. Good recommendations.—H. C., Town Mill Cottage, Dartford, Kent.

FOREMAN, in a good establishment.—Sixteen years' experience in good places. Excellent references as Foreman. Four years here. — FOREMAN, Elvaston Castle Gardens, Derby.

FOREMAN, or GROWER.—Practical knowledge of London Trade; been in charge of Market Nursery for the last four years.—M. A., Mr. Dale, 9, High Street, Mitcham, Surrey.

FOREMAN, in the Houses, in large establishment.—Age 29, single; good character from last situations in large establishments as Foreman.—W. WRIGHT, Tilbury Hill, Halstead, Essex.

FOREMAN, in the Houses, or good SECOND GARDENER.—Age 24; two and a half years' good character, and several previous. Free to engage.—J. MERRICK, The Gardens, Hendrefoilan, near Swansea.

FOREMAN (General), or SALESMAN, in medium establishment, Trade or Retail.—Age 28, single; fourteen years' practice. Twenty months good character. Good references.—H., 95, Henslowe Road, East Dulwich, S.E.

FOREMAN (Inside, or General).—Age 28. Mr. G. R. GEORGE, Gardener to Earl Sondes, Lees Court, Faversham, wishes to recommend his late Foreman and Decorator as above. Three years as Foreman previously.—Present address, G. W. RAYMENT, Poles Park, Ware, Herts.

JOURNEYMAN (First), Inside. — Age 22; CHAS. BLICK (Gardener to Martin R. Smith, Esq., The Warren, Hayes, Kent), can confidently recommend John Rutherford, as above, who has been here for three and a-half years.

R. GURNEY, Gardener, The Hall, Rotherby, Leicester, seeks a situation for his son as SECOND JOURNEYMAN under a good Foreman. Age 18; has had five and a half years' experience. Good character. Bothy preferred.

JOURNEYMAN, in the Houses, or Inside and Out, under a good foreman; age 21. Life experience; good references.—S. WISE, Highmoor, Henley-on-Thames, Oxon.

JOURNEYMAN, or SECOND.—Three years' good character; seven years' experience.—ARTHUR DURBIDGE, Bramley, Basingstoke.

Friday Next.

Most IMPORTANT SALE of
A GRAND RE-INTRODUCTION
of about 400 Plants of
CATTLEYA MAXIMA GIGANTEA.

Messrs. Linden, the Re-introducers of the famous old Cattleya labiata autumnalis, have great pleasure in announcing to their honourable patrons that they have been fortunate enough to re-introduce another long-lost magnificent Cattleya, one of the handsomest and most remarkable Cattleyas known, the CATTLEYA MAXIMA GIGANTEA.

Discovered in 1861 by G. Wallis, when collecting for Mr. J. Linden, only a few plants then reaching Europe alive. It was at one time a well-known feature in the celebrated collection of Mr. Day, about 25 years ago. Since the first introduction, many attempts to re-introduce this grand Orchid have failed.

Our diligent Collector, who was fortunate enough after long research, following the traces left by Mr. Wallis, to secure the plants, confirms that this variety bears as many as twelve large flowers of the brightest colour on one stem. An inspection of the old flower-scapes will prove the truth of his assertion.

☞ The plants are of the most robust appearance, with very stout bulbs, from 1½ to 2 feet high, similar to Lælia elegans in appearance, and have arrived in the best possible condition.

Also
CATASETUM BUNGEROTHI, a number of fine established unflowered plants, with flower-spikes.
Also a quantity of imported Plants of
ODONTOGLOSSUM KRAMERI, O. CIRRHOSUM MAXIMUM, O. EDWARDI, O. HALLI,
CATTLEYA SKINNERI.
And others just to hand in fine condition.

MESSRS. PROTHEROE & MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, E.C., on FRIDAY NEXT, November 16, at 12,30 o'Clock.

On view Morning of Sale, and Catalogues had.

Ottershaw Nurseries, near Chertsey, Surrey.

About 1 mile from the Chertsey Station.

Highly important FOUR DAYS' SALE of exceptionally well-grown NURSERY STOCK, for which these Nurseries are so famed, by order of Messrs. Fletcher Brothers, in consequence of the decease of the late Mr. William Fletcher, and retirement of his Executrix from the business.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, as above, on MONDAY NEXT, November 12, and three following days, at 12 o'Clock precisely each day, without reserve, 20,000 Evergreens and Conifers, adapted for immediate effective planting, and including 100 lots of fine grown Border Shrubs, and extensive quantities of Cupressus, Retinosporas, Thujas, and Piceas, 10,000 Weymouth and other Pines, 1,500 Gold and Silver, Variegated and Green Hollies, 500 Bushy Portugal Laurels, 3,500 Laurels in variety, 1500 Rhododendrons, 1½ to 5 feet, best named sorts, 2,000 Ponticum Rhododendrons, 1½ to 2½ feet, 500 Kalmias, 5,500 Standard and Dwarf Roses, embracing 1,500 Standards, and 4,000 Dwarfs, all carefully named; 30,000 Manetti Stocks, 10,000 Apple Stocks; 4,000 Standard Ornamental and Forest Trees, 6 to 15 feet, consisting of Limes, Poplars, Elms, Horse Chestnuts, Birch, Planes, Laburnums, Spanish Chestnuts and Mountain Ash; 500 Weeping Elms, with fine heads and good stems; 3500 Copper Beech, 3 to 7 feet, beautifully coloured; large quantities of Flowering and Deciduous Shrubs in variety, 30,000 extra strong Quick, 7000 strong Larch, 2 to 4 feet, Ampelopsis Veitchi, Ivies in pots; 8700 Fruit Trees, cleanly grown and true to name, comprising 3000 Standard and Bush Plums and Cherries, 1500 Farleigh Damsons, 2000 Standard and Bush Apples, 2000 Standard and Bush Pears, 250 Dwarf Trained Peaches, Apricots, Nectarines, and other Stock.

May be viewed. Catalogues may be had on the Premises; and of the Auctioneers and Valuers, 67 and 68, Cheapside, London, E.C.

The Windlesham Nurseries, near Bagshot, Surrey.

GREAT SALE of magnificently grown young NURSERY STOCK, by order of the Executors of the late Mr. Richard Mason, in consequence of the

FRIDAY NEXT, November 16. **MOST IMPORTANT SALE.**

A GRAND RE-INTRODUCTION of about 400 splendid Plants of

CATTLEYA MAXIMA GIGANTEA.

MESSRS. LINDEN, the re-introducers of the famous old CATTLEYA LABIATA AUTUMNALIS, have great pleasure in announcing to their respective patrons that they have been fortunate enough to re-introduce another long-lost magnificent Orchid, one of the handsomest and most remarkable Cattleyas known, the CATTLEYA MAXIMA GIGANTEA. Discovered in 1864, by G. Wallis, when collecting for Mr. J. Linden, only a few plants reached Europe alive. It was a well-known feature in the celebrated collection of Mr. Day, about twenty-five years ago. Since the first introduction many attempts to re-introduce this grand Orchid have failed, and no other plants have been met with. Our diligent Collector, who was fortunate enough, after long research, in following the traces left by Wallis, to secure the plants, states that this variety bears as many as twelve large flowers of the brightest colour on one stem. An inspection of the old flower scapes will prove the truth of his assertion.

The Plants are of the most robust appearance: thick bulbs from 1½ to 2 feet high, similar to Lælia elegans in appearance, and in the FINEST POSSIBLE CONDITION.

And OTHER FINE ORCHIDS, to be OFFERED by PUBLIC AUCTION, at

WELLS' NEW CATALOGUE OF CHRYSANTHEMUMS,

Contains the description of nearly 1000 best varieties, and more useful information than any other such book ever published. Including a Coloured Plate of his New Green Chrysanthemum, "Ethel Amsden." The Novelty of the Season. Post-free, 4*d*., from **W. WELLS, Earlswood Nurseries, Redhill, Surrey.**

NEW AND BEAUTIFUL HARDY SPIRÆA.

SPIRÆA ANTHONY WATERER.

This is a sport from the well-known Spiræa bumalda, from which it differs only in colour, the flowers being a rich crimson, borne in large corymbs thickly on the plant.

It is a continuous bloomer, and is without doubt the most important addition to hardy flowering plants of many years.

FIRST-CLASS CERTIFICATE,
Royal Horticultural Society of London.
Nice plants, 7*s*. 6*d*. each, will be distributed in November.

ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey.

DICKSONS, CHESTER.

THE

Gardeners' Chronicle.

SATURDAY, NOVEMBER 10, 1894.

EDWARD LEEDS,

THE RAISER OF THE LEEDS' VARIETIES OF NARCISSUS.

THIS is a brief record of a quiet life, the memory of which survives with the flowers. When spring comes with its Daffodils, every florist wonders who Leeds was, who raised so many beautiful varieties. He led such a retired life, and had such an uneventful history, that few of his contemporaries knew of his botanical pursuits; and he only lived to see a few of his Daffodils in bloom.

Edward Leeds may be considered a "Manchester man," as he was born at Buile Hill, Pendleton, within 4 miles of the Exchange, September 9, 1802. His father, Thomas Leeds, was a citizen of Norwich, and Edward was the eldest son. His mother was a daughter of Joseph Rigby, of Swinton Park, near Manchester. He was educated at John Hathersall's school on Ardwick Green, Manchester, and even in boyhood he was passionately fond of flowers, and spent his pocket-money in plants which he bought in Smithy-door-market, in Old Manchester. Oddly enough, his school nickname was "Bulbous."

Thomas Leeds had a mill at Gerards, near Gee Cross, where he manufactured a superior kind of cotton-thread. It was unfortunately burned down, which caused him to come to Manchester, where he tried to establish a property agency, and not being successful he settled down to share-broking, and with his son Edward took a small office in St. Ann's Churchyard.

Edward Leeds was thus brought up to the business, but it is doubtful if he ever entered the Stock Exchange as a member. He had an outside practice, and dealt largely in mining shares. He was greatly influenced in his early love for gardening by Thomas Glover, a keen naturalist, who continued the pursuit of his natural history hobbies, especially botany and conchology, to an advanced age. I visited him at Southport, March 14, 1885, when he was in his 90th year, and found him busily arranging his collection of shells. In 1828, Mr. Glover lived at Sharston, near Northenden, then quite a country place, and difficult of access from Manchester. He had a large garden and greenhouses, and specially cultivated Camellias, of which he had many varieties. He succeeded in raising a good many seedlings, one of which he sold for 60 guineas, to R. S. Yates, a Manchester florist. It was named the Duke of Lancaster. This, with many other seedlings, was raised from seed obtained by crossing the double Camellia Warratah with pollen from other sorts. Warratah had a very prominent pistil and poor stamens. It was thus easily fructified, and as the petals fell away the seed-pods became very prominent. It was while Mr. Glover was busy with thus obtaining seedling Camellias by artificial crossing, that he became acquainted with

*

Mr. Leeds, who visited him frequently at Sharston, and took a great deal of interest in what was going on. No doubt he was thus led into similar cultural experiments.

Mr. Glover afterwards removed to Smedley Hill, where Leeds frequently visited him. Mr. Glover never knew Dean Herbert. Mr. Leeds was a candidate for the curatorship of the Manchester Botanical Gardens in the year 1828. He was one of the selected in the last lot, but failed to obtain the appointment, which fell to Mr. Mowbray. At this time he was described as a short, stout man, like a pollard Oak, and sociable and pleasant. He went to reside at Longford Bridge, near Stretford, about the year 1835, and lived there for forty-two years, during the whole of which time the garden was cultivated with most loving care. It was a place difficult of access, about four miles from Manchester, reached by the omnibus which then plied from Manchester to Altrincham. The house was a good roomy cottage, with a large square garden of perhaps an acre around it, on rich alluvial soil, near the River Mersey. The place soon became notable to gardeners and botanists, and was the meeting-ground for old Lancashire florists. Tulips, Auriculas, Carnations and Pinks were grown there as hobbies, and the wider cultivation of Alpine plants was pursued with ardour. The Lancashire florists at this time knew all about the improvement of flowers by careful crossing, and Leeds thus gained the knowledge he afterwards carried into effect with the Narcissi.

Leeds was a sportsman, and frequently made long excursions on fishing expeditions in which he was joined for several years by Mr. Glover. They generally went to Teesdale, which was, in those days, a paradise to the botanist. They used to find Gentiana verna in such plenty that the whole valley was blue with it. In these excursions many were the plants collected for the herbarium and also for the garden. During his lifetime Mr. Leeds made a large collection of dried plants. Sir W. Hooker was his correspondent from 1839 to 1858, and they frequently exchanged specimens. Dr. Hooker visited his garden, and ultimately Mr. Leeds gave his herbarium to Kew. When sent away it filled three large cases. Another frequent visitor to Mr. Leeds' garden was Mr. Nuttall, a celebrated American botanist, who published a flora of that country. John Windsor, author of *The Flora of Craven*, an excellent botanist, was also a friend of Mr. Leeds, and a frequent visitor to the Longford garden, which he used to say he would rather see than the Botanical Gardens. Mr. Tyerman, curator of the Liverpool Botanical Gardens, was also a frequent visitor and correspondent. The Rev. Canon Ellacombe, of Bitton, corresponded with Mr. Leeds, but they had no personal acquaintance. From correspondence kindly lent, I find he was then cultivating Artemisia frigida, a rare silvery-foliaged Alpine, Allium sub-hirsutum and A. neapolitum, then new plants to British gardens, Soyera montana which he had grown from seed forwarded from the Pyrenees, Milla uniflora, and some varieties of the Dahlia, probably the Juarezi group. Mr. Ellacombe sent him Stokesia cyanea which he had lost, and several of the rarer Campanulas. General Seager, his brother-in-law, brought him many plants and seeds from the Crimea.

About this time we come upon the true commencement of Narcissus culture in England. The Hon. and Rev. W. Herbert came to Manchester in 1840, and died in 1847. The late R. S. Yates told me that he soon became acquainted with Mr. Leeds, and visited his garden. The influence can thus be thoroughly established, and as Mr. Leeds was ripe for the subject by his early training and pursuits, it at once took hold of his energetic mind.

The *Botanical Register* for August, 1843, contains Dean Herbert's article on the Hybrid Narcissi, which is at the foundation of the matter. The editor says, "For the very curious information conveyed in the following pages, we are indebted to the Hon. and Very Rev. the Dean of Manchester, whose experiments in hybridising plants have now assumed precision and importance which could scarcely have been anticipated. We particularly commend the facts here detailed to the attention of the botanist. . . . . There are six Narcissi drawn in plate 38—four of the Incomparabilis group, one variety of Biflorus, and a white Trumpet Daffodil. They were raised from seeds at Spofforth, Dean Herbert's Rectory in Yorkshire. Eight years previously he had made a collection of Narcissi for the completion of his great work on the Amaryllidaceæ, and up to that time no one had ever known a seed to have been produced by any one of the Narcissi enumerated. They had been cultivated 200 years, and yet their places of abode were unknown to Clusius and Parkinson, and a suspicion arose that they were artificial breeds, which some cultivator had imposed upon the public as mountain plants two centuries ago. Herbert had first published an advertisement stating that suspicion, and requesting seeds, and the the seed of N. odorus being named in the list of the Botanical Garden at Naples, application was made for some, without success. The result was that bulbs of many Narcissi were sent to Spofforth, but no seeds. Herbert at once set to work to solve the riddle by growing the bulbs he had thus obtained, and getting them to produce seed by artificial fertilization. No. 5 had been obtained by pollen from poeticus; No. 3 from incomparabilis, crossed with poeticus, he found also that the pollen from the cross was fertile. Every cross is carefully detailed in this paper, and the rule that governs the subject is carefully set forth by the results of the experiments. It is a most interesting communication, showing how clearly Herbert saw the results which would ultimately follow. He concludes with these remarkable words, "It is desirable to call the attention of the humblest cultivators, of every labourer, indeed, who has a spot of garden, or a ledge, or window, to the infinite variety of Narcissi that may be raised, most easily in pots, at his window, if not too much exposed to sun and wind—offering him a source of harmless and interesting amusement, and perhaps a little profit and celebrity."

At this time, no doubt, Leeds knew Dean Herbert, and it is to this paragraph that we must look for the incentive to his labours, which have proved the truth of the Dean's prevision in so remarkable a manner. Finally, Dean Herbert detailed the process he followed in hybridising the Narcissi:—"The six anthers should be carefully taken out before the flower which is to bear seed blows. This may be done through a slit cut in the tube, and the yellow dust from another sort must be applied to the point of the style." *Wm. Brockbank, Brockhurst, Didsbury*, 1894.

(To be continued.)

New or Noteworthy Plants.

EUCOMIS ROBUSTA, *Baker, n. sp.**

This new species of Eucomis is remarkable for its very robust scape and large flowers. It is nearest to E. regia, Ait (E. clavata, Baker, in *Saund. Ref. Bot.*, t. 238), from which it differs by its narrow, long, ensiform, acute leaves. It has been introduced into cultivation by Messrs. Dammann & Co., of Naples, from the neighbourhood of Kœnigsberg in Natal. The scape and leaves are destitute of purple spots, and the leaves, both of the radical rosette and of the coma that crowns the raceme, are very thick in texture.

Basal leaves ensiform, acute, 2 feet long, 2 inches broad at the middle, narrowed gradually to the base and acute apex, plain green, very thick in texture, channelled down the face, crisped on the margin. Scape very short, plain green, an inch thick. Raceme dense, oblong, 6 to 8 inches long, above 2 inches in diameter, crowded by a "coma" of twenty to thirty oblong-acute, reduced, plain green leaves, crisped on the margin; pedicels ascending, stout, ⅛ to ½ inch long; bracts ovate, acute, plain green, longer than the pedicels. Perianth ⅝ to ¾ inch long; tube campanulate; segments oblong-spatulate, tinged with brown on the back. Filaments lanceolate, not more than half as long as the perianth; anthers small, oblong. Ovary globose; style short. *J. G. Baker.*

* *Eucomis robusta*, Baker, n. sp.—Foliis ensiformibus acutis bipedalibus crassis viridibus immaculatis margine crispis; scapo brevissimo crasso clavato immaculato; racemo denso oblongis foliis reductis multis oblongis acutis coronato; perianthii tubo campanulato, segmentis oblongo-spathulatis viridibus dorso fusco tinctis; filamentis lanceolatis perianthio distincte brevioribus.

EDINBURGH ROYAL BOTANICAL GARDEN.

Mimosa latispinosa.—This Madagascan species is now flowering in the Palm-house at the Royal Botanical Garden, Edinburgh, where it is trained upon the roof of the annexe. The plant, a climber, has slender stems, crowded with short spines. The alternate bipinnate foliage is of a light and graceful character, the leaves being more than 1 foot in length, bearing a large number of pinnæ; the light green leaflets upon these numbering from ten to twelve pairs, are arranged on light-coloured compressed spines. The terminal panicles bear white flowers, which have the fragrance of Hawthorn. Although introduced to this country in 1823, it is still rare in gardens.

Clerodendron nutans.

A good specimen of this free late-flowering species may now be seen in the Palm-house, and although a useful plant for pot-culture, it does not show to the same advantage as when planted out. The plant is carrying more than fifty of its long drooping racemes of flowers, which have a greenish-white calyx, and a white corolla. The foliage is about 6 inches long, and of a dark green colour. During the growing season it should receive frequent stoppings to secure an even growth of flowering shoots.

Musa coccinea.

This highly ornamental species is a good plant of dwarf habit, the bracts, which are very conspicuous, being quite attractive. The leaves are about 1 yard long, and 9 inches broad, and the scarlet bracts are about 8 inches long, and tipped with yellow, lasting a considerable time in perfection. The plant has long been known to cultivation, and is a native of China or Cochin-China. It was figured in the *Botanical Magazine*, t. 1559. *R. L. H.*

Orchid Notes and Gleanings.

AËRIDES SAVAGEANUM, *Reichenbachia*, t. 81.

A native of the Philippine Islands, introduced by Messrs. Sander, and shown by them and others at the Temple Show, May, 1891. It is related to A. Leeanum. Under cultivation it has been found to be a very free grower if placed in the warm house section of Aërides, such as A. quinqevulnerum, A. Lawrenceæ, and A. Sanderianum, or if grown in the warm end of the Dendrobium-house; for an even moderate temperature suits it better than a very high one. It is remarkably vigorous and free-flowering; the flowers present "every imaginable shade of crimson and purple, and in some cases the basal half of the sepal is pure white. It requires, according to Messrs. Sander, abundance of moisture and a clear light, but should be shaded from direct rays of the sun in summer. The temperature of the Orchid houses should be 7° to 10° F. less at night than in the day."

Thunia Brymeriana, *Reichenbachia*, t. 82.

Introduced by Mr. Brymer, and described as the showiest and most beautiful of the genus, while the flowers remain longer in beauty than do any of its congeners. It is stated to be of easy cultivation; if its old stems are cut into lengths of 2 to 3 inches, and a number placed together in ordinary cutting-pots, they will give young plants almost as freely as a Pelargonium, and when its flowers are matured it is not in the least injured by cutting, whatever growths are required for decoration. In the spring the plants should be repotted, each stem being

securely fastened to keep it upright, a turfy-yellow loam mixed with a little chopped sphagnum and sand being a suitable material in which to pot them.

Miltonia spectabilis var. Moreliana, *Reichenbachia*, t. 83.

The Miltonias of this section have the reputation of being difficult to grow, but if properly managed this is not the case. Messrs. Sander recommend a shady but light corner of the intermediate-house, and a temporary staging to bring the plants near the glass. Well-drained shallow pans or baskets suit them best, as they require an abundance of rain-water when growing, but a free drainage must be secured. The pseudobulbs must not be allowed to shrivel for want of sufficient moisture at the roots.

Oncidium Kramerianum, *Reichenbachia*, t. 84.

This differs from O. papilio in having a more terete scape, which does not become flat in the upper half as in O. papilio, in the very prominent nodes at the joints of the flower-spike, the shorter and broader segments of the flower, and in the somewhat different arrangement of the parts of the crest and columns. It requires much the same treatment as Miltonia Roezlii. An even temperature of 60° to 70° F. in a moist house, not too heavily shaded in summer, suits it admirably. It is a native of the Andes of Ecuador and New Granada.

Fig. 72.—Stenoglottis longifolia: colour of the flowers mauve purple.

Cattleya labiata, R. I. Measures' Variety.

It is a very great source of pleasure to an amateur to flower such a marvellously beautiful and distinct form as the superb white variety of autumn-flowering Cattleya labiata found in the collection of R. I. Measures, Esq., Cambridge Lodge, Flodden Road, Camberwell. It is also an additional pleasure to possess so fine a specimen of the variety, which has thrown two spikes, one bearing two, and the other four, flowers.

The flowers are pure white, except for a small space at the base of the labellum beneath the column, which is of a primrose-yellow hue, and a faintly-tinted, well-defined veining of pure pink over the front lobe. In the small amount of colour which is in this pretty albino there are two peculiarites—firstly, the presence of scarcely any yellow colour in the tube of the lip, peculiar to the species, and a strongly-marked feature in C. labiata alba; and secondly, that the pink colour is displayed in distinct lines, which follow the veining, and not as a hue suffusing the whole surface, peculiarities which render the plant unique. The history of it is singular, and worth recording. It caught the eye of Mr. H. J. Chapman, the gardener at Cambridge Lodge, when examining an importation of C. labiata at the nursery of Messrs. F. Sander & Co., St. Albans, and the plant was secured for a few shillings. The same instinct, or whatever it might be called, which decided his choice in the matter, prompted him to carefully watch it, in the full belief that it would prove a novel variety—a belief that has not been belied. An offer of 200 guineas has been made for the plant, but it is destined to remain at Camberwell, to bear company with the many remarkable plants already there. *James O'Brien.*

STENOGLOTTIS LONGIFOLIA.

This is a really first-rate greenhouse Orchid, easily cultivated, and free-flowering, whilst its flowers last about three months (Fig. 72). It was introduced five years ago from Natal to Kew, and was first described in these columns (1889, vol. ii., p. 438) by Mr. N. E. Brown, as a variety of S. fimbriata, but was elevated to the rank of a species by Sir Joseph Hooker, in 1891, who figured and described it in the *Botanical Magazine*, t. 7186. Both species are cultivated at Kew, S. fimbriata being a small plant with a rosette of leaves, which are green, banded with dark brown, and a few-flowered scape, 6 inches high. It was introduced in 1870, first flowering that year with Mr. Wilson Saunders. It is a pretty little Orchid, and is not uncommon in some parts of the Cape, where it is usually found clinging to stones in shady, moist places. Its leaves are deciduous. S. longifolia has strap-shaped, undulated, semi-erect leaves, 9 inches long, green, with a tinge of purple near the base, and they are evergreen. The scape is 18 inches high, the upper half being clothed with mauve-purple flowers. The plant at Kew this year bears five fine spikes of flowers, and it has been in bloom about two months, and is quite fresh yet. Apparently it may be increased by means of offsets, which spring from the base as in some of the Disas. *W. W., Kew.*

Plant Notes.

AMPELOPSIS HEDERACEA.

This is useful for intermixing with strong-growing Ivy. We have both of the latter growing very freely together on the castle here, and I notice they have reached the parapet. We afford plenty of manure-water to the Ampelopsis during the season of growth. I wish to say that my employer, Colonel Cooper, suggested planting Ampelopsis hederacea against a Scotch Fir or two in a hardy fernery we have here. I have done so, and the effect is very good; it is a relief and contrast to some Ivy-clad Scotch Firs. *H. M.*

Crataegus pyracantha Lelandii.

This is a desirable shrub, which does well when planted in a good porous soil, and near to a wall with a south aspect. At this season of the year it is covered with its scarlet fruits, and being an evergreen, it is a presentable object after the berries are off. *H. May, Markree Castle, Collooney, Sligo.*

French Marigold, Legion of Honour.

This very pretty distinct variety will be found an acquisition as a summer decorative plant, and when more known will be a popular favourite. It is of dwarf compact habit, growing not more than 12 inches in height, flowers profusely, and remains flowering until frost destroys it. It is a single-flowered variety, with a profusion of medium-sized flowers of a yellow colour, the base of each petal having a bright brownish-crimson spot. Being an annual variety, it is only necessary to obtain seed and sow it in April for planting out at the end of May or early in June. *W. D.*

A HOME-MADE FERTILISER.

Every intelligent gardener knows the value of wood-ashes as a fertiliser, and until a comparatively recent period wood-ashes were really almost the only commercial manure that was procurable in America, artificial manures not having come into use in that country. But it is somewhat remarkable that the value of wood-ashes and the beneficial results of their application to the soil, are generally attributed solely to the potash which they contain. Undoubtedly potash is an indispensable food for plants, and its application to crops is usually marked by conspicuous results. Those gardeners, however, who have had long experience with potash in the form of wood-ashes, and also as potash salts or kainit, find that the latter is not so marked in its effects as the former. The fact is, that as recently remarked by Mr. S. Macon in the *American Agriculturist*, wood-ashes are really a mixed fertiliser, and a complete one so far as the mineral elements of plant-food are concerned. This must be apparent to anyone who considers that they are the whole residue of plants after being burned, except that part which returns to the atmosphere from which it was originally procured.

The nitrogen and the carbon of the trees alone are thus wanting in the ashes, which contain everything else required by plants. Thus it is only reasonable to infer that the benefit derived from a dressing of wood-ashes to any crop, must be due to the other elements as well as to the potash.

Of course, the value of ashes may vary considerably according to their source, though practically this variation is less than would be supposed at first sight. Ashes are richer or poorer in potash and other useful ingredients according to the kinds of plants from which they are obtained, and to the character of the soil upon which the plants grew. Also it is found, that the value of the ash varies according to the parts of the plant that have been burned. The ashes of twigs (faggots for example), would always be worth much more for horticultural purposes than the ashes of heart-wood taken from the middle of an old tree; and in general the smaller and younger the wood burned the better would be the ashes.

Taking what is known of the composition of the ashes from young twigs and that from heart-wood which has fully matured, one would say that the proportion of potash in ashes may vary from 5 to 20 per cent. But a much better criterion of the real composition of ashes is afforded by the experience of potash manufacturers, according to whom a bushel of wood-ashes weighs about 48 lb. on the average, and yields rather more than 4 lb. of potash salts. Professor Storer has investigated this question somewhat in detail, and has found by the analyses of a number of samples of wood-ashes that selected specimens contain 8½ per cent. of real potash, and 2 per cent. of phosphoric acid; or say 4¼ lb. of potash and 1 lb. of phosphoric acid per bushel of ashes. Hence there is enough potash and phosphoric acid to make the bushel of wood-ashes worth from 10*d.* to 12*d.*; and besides that, some 5*d.* to 7*d.* additional may be allowed for the "alkali power" of the ashes. This may be explained as the force of alkalinity which enables wood-ashes to assist in the rotting of weeds, and to ferment peat.

The notion that the ashes of soft woods, such as Pine and Poplar, are worthless, is an error. The soft woods yield comparatively little ashes, and the ashes are so light that they may readily be blown away by the wind; but weight for weight, the ashes from soft woods appear to be as good for horticultural purposes, or nearly so, as those from hard woods.

The percentage composition of wood-ashes commonly used by gardeners is as follows:—

Selected Plant-food Ingredients in Wood Ashes.

Ash of —	Potash.	Lime.	Phosphoric Acid.
	Pr. cent.	Pr. cent.	Per cent.
Beech wood	16·1	56·4	5·3
Oak ,, ...	10·0	73·5	5·5
Elm ,, ...	21·0	47 8	3·3
Apple ,, ...	12 0	71·0	4·6
Fir ,, ...	11·8	50·1	5·8
Poplar ,, ...	14 0	58 4	13·1
Pear ,, ...	4·2	77·2	3 8
Cherry ,, ...	20·8	28 7	7 7
Average of 25 descriptions of Trees	5 5	31·3	1 9

The barks of trees are still more rich in lime than in potash, than is shown in the foregoing table. And as all plants contain lime, this element of the ashes should be taken into account, as well as the other ingredients, for it is known that the production of nitrogenous plant-food goes on most easily in soils that have a considerable proportion of lime in them. Indeed, it may be said that this supply of lime is indispensable to the action of the nitrification-bacteria, which must have lime within reach for its proper development.

Action of Potash on Soil-nitrogen.

An objection is sometimes made to wood-ashes as a manure for horticultural purposes, that the plants to which they are applied grow coarse. This may be due to the nitrogen supplied to the plant by the action of the potash on the humus of the soil. This power of potashes to make the nitrogen of the soil available for plants is undoubtedly a valuable one, and is strikingly shown in clearing wooded localities. For wherever a heap of wood and scrub is burned, it is noticed that vegetation afterwards is apt to be particularly rank and luxuriant precisely where the largest quantities of ashes are lying. This rankness of growth is doubtless to be attributed first to a superabundant supply of nitrogenous food brought into activity by the aid of the ashes, though it is believed that the spots charged with alkali from the ashes are in many cases better supplied with moisture by capillary action than the surrounding portions of ground.

Investigations have proved that commercial potash fertilisers, used as such, are decidedly inferior for plant-growth to wood-ashes. The explanation of this fact seems to be that the sulphate and the chloride of potash are devoid of the alkaline quality which is so marked a peculiarity of carbonate of potash which, as is well known, is the effective agent in wood-ashes.

As an illustration of the value of wood-ashes as a fertiliser, I may mention the following fact which has just been brought to my notice. A gentleman in Nottingham has two Vines, which are very old, and were said to be worn out; they had not produced a satisfactory crop for several years. In 1893 they yielded 20 lb. of Grapes of a very inferior quality. In the autumn of 1893 they were heavily manured with a mixture of wood-ashes and kainit, with the result that in 1894, the present year, the two Vines yielded 120 lb. of Grapes of excellent quality. The potash in the wood-ashes, combined with the potash in the kainit, matured the wood of the Vine, and developed the fruit-buds. It will be of interest to learn what the result of 1895 will be, but I should think a little more potash will have to be applied in the present autumn, to make up for the drain upon this element by the large crop just gathered. *J. J. Willis, Harpenden.*

FORESTRY.

TRANSPLANTING TREES.

The season for this operation is now upon us, and from the present time to the end of March, transplanting may be carried on whenever the absence of frost or snow permits. Probably every planter has his pet views concerning this subject, based upon his own experience of certain soils, situations, and climatic conditions. These views vary little regarding the exact method of carrying out the work, but considerable difference of opinion exists as to the best time or month for its execution. Without wishing to dogmatise upon the subject, I am inclined to the belief that no great importance need be attached to any particular month for planting, but that a great deal depends upon the conditions and circumstances which are likely to affect the transplanted trees.

In the first place, the physiological peculiarities and the roots of the particular species undoubtedly play an important part. The transplanting of evergreens is usually attended with more risk than that of deciduous trees, and those with a naturally taproot habit require more care than plants with plenty of fibrous roots. Evergreens, except perhaps during severe frost, are never independent of the functional activity of their roots. Transpiration proceeds more or less throughout the whole dormant period, and under normal conditions, root absorption makes good the loss so sustained, but when a tree is transplanted in the ordinary manner, a certain number of the rootlets (which alone bear root-hairs), are broken off or destroyed. This means that the supply of moisture or sap to the leaves is reduced in quantity, but so long as sufficient feeding roots to supply the minimum amount required are left intact, the vitality of the plant is not endangered. When, however, the root system is so reduced or injured as to render an adequate supply of moisture to the leaves impossible, the existence of the tree depends principally upon the humidity of the surrounding atmosphere and the temperature of the soil, together with the tree's inherent power of producing fresh feeders. With a humid atmosphere and a warm soil, transpiration is reduced on the one hand, and root-formation favoured on the other, so that the tree has a good chance of repairing the loss its roots have sustained, before any great demand is made upon it. A spell of warm and moist, but not excessively wet, weather at and after planting-time, is consequently very favourable to recovery, and those who advocate the latter end of October or the beginning of November for planting the majority of the kinds of evergreen trees, have good reasons for so doing, when we consider the prevailing type of weather at that season, and the warmth latent in the soil.

The same principles equally apply to the planting of deciduous trees, but as transpiration cannot proceed without leaves, the plants do not feel the want of feeding-roots before growth begins. This is proved by the fact that hardwood, and certain coniferous timber cut in winter, frequently throw out adventitious shoots from the trunk, and even the ordinary buds partly open if the tops are not removed. Transplanted hardwoods usually push out new shoots even when insufficient roots have been preserved, but growth can only proceed so long as the stock of reserve material holds out. Thoroughly-ripened wood in the transplanted tree is therefore an additional advantage, both on account of the reserve material it contains, and the immunity it enjoys from frost injuries.

As a rule, then, hardwoods may be safely transplanted whenever the weather is suitable, but we should never advise planting in the months of December or January, or later than the middle of March. It is during the first-named months that

root-action is most inactive, and broken root surfaces are less likely to become calloused during spells of frosty, snowy, or wet and cold weather, which usually prevails during the months named. In such weather, the return to the normal condition which transplanting interrupts, is retarded, and in recently-stirred soils frost enters to a considerable depth. After the middle of March, again, the roots have little time to start a fresh growth before the increase of warmth excites the buds into activity, by which time the roots are required to carry on growth, and those formed previous to lifting are usually destroyed in the operation. When planting in these months is unavoidable, as when a large area is taken in hand in one season, it is a good plan to lift a sufficient number early in November, and lay or "sleugh" them in on the site of planting operations. They can then be planted in suitable weather without the roots being seriously damaged a second time by lifting and exposure. Of course no advantage would be gained by this method if less than a month elapsed between lifting and replanting, and by laying-in I do not mean packing soil round a bundle of fifty or a hundred, but spreading them out in the trench, so that the soil comes in contact with the roots.

A point which is frequently overlooked is the necessity for bringing the rootlets in close contact with the soil. Unless this be done, the root-hairs cannot take up mineral solutions, and are of little assistance to the plant. This requires special attention when planting large specimen trees with dense masses of fibrous roots. In such cases, the soil round the outside of the ball falls away in lifting, and when replanted the extremities of the roots are often pressed down together instead of being surrounded by soil. A good method of obviating this evil is that of lightly covering the roots with fine soil, and then pouring, from a watering-can with a coarse rose, enough water to convert the soil into a muddy mass, afterwards filling in with the rest of the soil. Sometimes watering is delayed until the late spring or summer, when probably some of the trees are practically dead, although still showing a vestige of green leaf. Dotting at such times frequently does more harm than good by chilling the soil and retarding the process of rooting it is intended to assist.

Generally speaking, the younger the trees are when given their final shift, the more likely are they to succeed. The advantages which are supposed to follow the removal of the tap-root, and the consequent increase in the number of fibrous roots, are, at the best, problematical, so far as the ultimate growth of timber trees is concerned. One of the functions of tree roots is to ensure stability, and Nature consequently gives them a more or less deep anchorage in the soil for this purpose. Although I am by no means convinced that frequent transplanting whilst young permanently alters the character of the root system, yet there are more unlikely theories propounded than that the removal of the primary tap-root may alter the quality of the timber. Gardeners do not usually object to the presence of a tap-root in a Cabbage, and why foresters should see any danger in a similar appendage to a young Oak or Pine, we do not know. Of course, large trees with strong tap-roots are not likely subjects for successful transplanting, but two-year seedlings might just as well be planted out into the plantation at once, as replanted in a nursery, and by so doing the cost of planting might be considerably decreased, and as good results obtained at the same time. *A. C. Forbes.*

Treatment of Plantations without Regular Thinning.

Cutting vistas is less expensive than regular thinning, the poles are removed with greater ease, as there is plenty of room in the vistas and holes, and the trees remaining are less likely to be injured. Your readers may think me presumptuous in cutting a third series of vistas, contrary to the advice of Prof. Marshall Ward, but he has not seen the plantation since 1886, whereas I work in it every year. In the year 1848 my father trusted me to thin a plantation of 6 acres, its first thinning, when I allowed myself fifty trees a day to cut; and one day, coming to a lot of small trees, I cut 100.

I have observed plantations and natural forests in many countries and climates, and claim to have greater practical knowledge than the learned professor has. The old vistas have closed up so much, that the plantation requires to have air let into it, and I am curious to see whether letting air into the field part, where so many trees die annually, will restore it to a healthy and growing state. The new vistas will not remove so many trees as may be supposed, as cuts have been made across their direction, and small and suppressed trees have been removed. *H. R.*

NEW SWEET BRIAR HYBRIDS.

These strong, vigorous hybrids of Lord Penzance's raising, should have plenty of room given them, so that the branches of one bush do not cross and

Fig. 73.—A hybrid sweet briar, in messrs. keynes, williams, and co.'s nursery, salisbury.

spoil the effect of those of another. They are undoubtedly seen to the best advantage planted out singly on a lawn with a few yards space of green sward between them. In this position the long graceful branches have a fine effect when in bloom.

On no account should they be pruned at any time, beyond removing any branches which it may be undesirable to keep. If pruned like ordinary Roses, they produce little or no blossom.

Each bush should have a stout stake 4 to 6 feet long, and to this a few of the leading branches may be tied, to prevent the plant being blown over by the wind, but the branches look best if allowed to hang gracefully and naturally.

They will not thrive under glass, nor can they be successfully propagated, except by budding or by cuttings in the open air. Winter grafting in heat seems to take all vigour out of them.

We made a suggestion in a recent issue that they might prove good subjects for forming hedges in gardens, a use the old-fashioned Sweet Briar is sometimes put to, but Messrs. Keynes, Williams, & Co., nurserymen, Salisbury, tell us that the cutting that a hedge requires would be inimical to their blooming.

The iron stake shown in the middle of our illustration (fig. 73) of one of these plants, is 8 feet above the ground level, thus affording an idea of the great vigour of the plant which overtops it by several feet. We are indebted to the kindness of Messrs. Keynes for the opportunity to figure the plant.

CHRYSANTHEMUMS ABOUT LONDON.

(Continued from p. 540.)

Woodhatch Lodge, Reigate.—The splendidly-kept gardens of T. B. Haywood, Esq., are remarkable for many features, but for none more so than the annual display of Chrysanthemums, which always reflect credit upon this enthusiastic amateur, and his skilful gardener, Mr. C. J. Salter. A visitor who may go down each year finds the collection staged with the usual regard for neatness, and in the Peach-houses, that are generally used for the purpose. Indeed, the standard of quality varies but little also, and the only apparent difference on entering the houses this season is, that we notice some of the new varieties which have been added during the year; and when we look a little closer, and inspect the individual blooms, it becomes evident that the Japanese varieties are not quite equal to the quality of last year, and again, that the incurved flowers, though late, will be better than they then were. Incurved blooms generally this season are being shown better than they were last year.

Immediately upon entering the house, there are capital plants and blooms of Colonel W. B. Smith, some showing the fascinating twisted character of the florets, and others more fully developed. The flowers do not last long, and some growers do not speak too kindly of the variety on this account. Wm. Seward is conspicuous among the group by reason of its colour; and some capital flowers of Jno. Shrimpton are grand. This bloom commends itself to us most when it is just finished, and the reverse is not seen, but only the soft velvety scarlet-crimson. W. H. Lincoln is a little thin; but there will be fine flowers of President Borel, which at present are not quite finished—the rose-coloured florets and yellow reverse will be pretty here. Mrs. Harman Payne is good, but a plant with the finest buds and of the best colour is late, and the flowers will not be fit for exhibition for some days. Viviand Morel, in the crown bud white, on other buds is rosy-pink, notably, in two instances. James Lynch is the name of a good crimson Japanese reflexed variety that Mr. Salter has received privately from Australia; the habit is good, and the plants have four fine medium-sized flowers of capital colour on each of them. Edwin Molyneux and Charles Davis are both of good quality, the latter varying in colour according to the bud that was "taken." W. Tricker is not finished yet, and Viscountess Hambleton is in about the same stage, but both promise to be good. Mrs. Norman Davis and Coronet both require more time. Mr. C. Shrimpton is good, and easily attracts the attention; whilst Louise is represented by a plant with four good but unfinished blooms. Beauty of Castlewood is only just bursting the buds, but Commandant Blusset is better than we had previously seen it. This new Japanese variety is a splendid acquisition in carmine-purple, and the blooms are of large size, deep, and, when well grown, are distinct from every other variety. Avalanche is conspicuous from the unusually large size of one of the blooms, and it may be noticed that King of Crimsons, though known so long, is still included in a first-class collection. Mdlle. Thérèse Rey is capital, and Lord Brooke will be good when the blooms are finished. Alice Seward is a good Japanese of rose-purple, and looked well here.

Prefet Roberts, certificated when shown recently by Mr. Stevens, has the best blooms we have yet

seen of the variety; when finished, it has the appearance of a large silver goblet. Sunflower will be capital, but at present has only a few of the blooms out, and some of the guard-florets have been removed through damp. Condor has run about as high as any of the plants, but its white flowers with bush-rose are very good. The Tribune is not yet out; but W. H. Fowler, one of Mr. Owen's varieties, a yellow reflexed Japanese, marked a little with scarlet, looked admirable. Of Anemone-flowered plants, M. Jules Benedict is a grand one, with good cushion, and a pretty canary-yellow in colour. As we have already said, the incurved flowers will be good, but few of them were finished when these notes were taken.

On looking through the well-managed Orchid-houses there will be seen some pans of Cœlogyne (Pleione) lagenaria, capitally flowered; also many and diverse forms of Dendrobium Phalænopsis Schroderianum, and some blooms of the delicate hybrid Cypripedium T. B. Haywood. The Zonal Pelargoniums are also good.

Chrysanthemums at the Royal Exotic Nursery, Chelsea.

An unusually good display of the Chrysanthemum, chiefly of the Japanese section, is to be seen at the above nursery. It is particularly rich in novelties of 1893, and of the current year, and the cultivation of all leaves little to be desired. We noticed fine blooms of the following:—W. H. Fowler (Owen, 1893); R. C. Kingston, the rosy-purple colour nicely brought out; Golden Gate, a good but rare American variety—it has done better than Golden Wedding; another American is Lilian B. Bird, a distinct purplish-lilac, still scarce—a tall grower; Le Verseau, rich carmine; John Shrimpton was very good; also Colonel B. W. Smith, a very variable flower when side-buds are selected; Mrs. Peter Blair, an incurved Japanese of a pale lilac hue, had many good blooms; also Madame T. Rey, J. C. Schwabe, Wilfrid Marshall, Mdlle. Marie Hoste, the last named having nice blooms on cut-backs; L'Isera, a white of Mr. Davis' raising, quite new; the pure white Princess May, Lord Brooke, and many more. In the absence of fogs and rain, the collection is likely to last in good order for a few weeks longer.

(To be continued.)

The Rosary.

DRESSING ROSES.

Dressing Roses! The simple and uninitiated in the art of Rose exhibiting may ask, what can be the meaning of this? If Roses are dressed, how, and in what way? To one who has lived all his lifetime amongst florists' flowers, the dressing of such subjects is of course a well-known practice; but it is only of late years that one so distasteful in itself, and so destructive of the best interests of the Rose, has been applied to the Queen of flowers. I have been used from early days to see it carried on amongst Carnations, Picotees, and Pinks; the Dahlia and the Chrysanthemum have been subjected to it; but one had fondly hoped the Rose might be spared this humiliation, but alas! it has come upon us, and every year the practice seems to be increasing. The National Rose Society has passed a rule against it, which will have, I think, to be made more stringent, if we are to not only scotch, but kill the monster.

Before proceeding further, let me first disclaim any sympathy with extreme views as the results of the practice. It has been said by some good authorities, "You see what the practice has done in other flowers; people have so dressed the Carnation and Picotee, that they have abandoned the culture of old florist varieties, and taken to border-flowers; they have seen the stands of beautifully-dressed and arranged flowers at exhibitions, and finding they could not grow anything like them (not being adepts in the art of dressing), have flown to the rougher and more showy border varieties." Again, it is said that the dressing of the incurved varieties of Chrysanthemums, which has been carried to such an excess, that half an hour is spent over making up the toilet of each flower exhibited, has led to their comparative neglect, and the more extended favour given to the Japanese varieties. Now, the statements with regard to both of these flowers are, I think, exaggerated. It may be true that in a few instances this has been the case, but the general preference given to the border Carnation and the Japanese Chrysanthemum is due to a different cause—the present taste for the growth of flowers generally being that of decoration both in the garden and for the house. Now the old florist types of Carnation and Picotee, refined and beautiful as they are, do not lend themselves to either of these purposes; they are dear, and ever will be to the true florist who will ever admire the wonderful patience and skill which has brought them to the state of perfection to which they have now attained. But for the general public whether in dressed or undressed state they have but little charm; the more showy and brilliant border flowers are much more to their taste. But let it not be supposed that even these escape the dresser's hands; let anyone examine stands of border Carnations at any of our exhibitions, and it will be found that they too have been manipulated; and as to the Japanese Chrysanthemums and the preference given to them, the same holds good. With a friend I examined the other day the beautifully-arranged table and other decorations at the Chrysanthemum exhibition at the Aquarium, and amongst all of them there was not a single incurved variety passed; small blooms of the Japanese varieties were the only ones to be seen.

But to return to the Rose, which ought to stand on an entirely different footing, and which has really never been considered a florist flower, it seems to be almost as thankless a task to dress it as to paint the Lily; and there is this difference between it and the flowers already mentioned, that whereas they can be and are operated upon at home, the Rose must be manipulated at the place of exhibition, and therefore, it is that on a show day we may see in some quiet corner an anxious exhibitor sitting over his boxes. He has a pencil and a pair of tweezers in his hand; with one he opens out the flower so as to give it a larger appearance, and with the other turns back the outside (sometimes indeed all the petals), so as to alter the character of the flower completely. He takes away, if possible, all bad petals, and generally gives, if not a wash, a brush up to his flowers.

Some two or three years ago this matter, which even then disturbed men's minds, was brought before the committee of the National Rose Society, and a rule was passed against over-dressing. This rule, from its very vagueness is inoperative; in one or two cases stands were disqualified, but at the same time it was well known that others managed with a little more skill to escape detection. I cannot but think that if the rule were made to make all dressing a disqualification, exhibitors, seeing what is the wish and intention of the National Rose Society, would fall in with the regulation. No instrument, pencil, or tweezers should be allowed to be used, and the object should be to have the Rose shown as cut from the tree; moreover, as I have said, dressing is not carried on at home, but at the place of exhibition, and exhibitors, if not influenced by the *morale* of the matter would probably be unwilling to expose themselves to detection. I do not think that the practice now very often adopted of putting a piece of bass round the blooms when carrying them to the place of exhibition, should come under this category. There is another advantage which would be gained at such exhibitions as the Crystal Palace by the adoption of some such rule: owing to the shortness of the time which, arising from the exigencies of the case can be given to judging, there is the greatest possible difficulty in getting the boxes ready by the appointed time; in some cases, at least, this does arise from this very practice, and therefore, if it were disallowed, it would greatly help both exhibitors and judges. In writing these remarks, I have been actuated by desire to uphold honest exhibiting, and also the character of the flower we love, both of which are jeopardised by this unseemly practice. *Wild Rose.*

The Week's Work.

THE FLOWER GARDEN.

By John Lambert, *Gardener, Powis Castle, Welshpool.*

WINDOW-BOXES, VASES, ETC.—Where plant-boxes are provided for the windows, they should now be cleared of their summer occupants, refilling the boxes with new soil if that which has served hitherto is not in a fairly good condition. For filling them use Dutch bulbs, Stocks, yellow and brown Wallflowers, &c., in addition to the small evergreen or variegated-leaved shrubs, such as Aucubas and Conifers, Euonymus radicans and japonica, New Zealand Veronicas, Skimmias, &c. The soil should be of a porous nature, and the drainage good. Where a good collection of shrubs and Conifers is in the possession of the gardener, very tasteful arrangements may be made in window-boxes—in fact, these may be made to look almost as pleasing as the more showy summer boxes. Some of the most useful Conifers for the purpose are the Cupressus Lawsoniana and its varieties, including albo-lutea and albo-spica; Retinospora plumosa, R. p. aurea, and R. squarrosa; but a difficulty will often be found in obtaining the two latter sufficiently tall for back rows, owing to their bushy habit. For front rows, any small plants of those enumerated will answer admirably, and may be interspersed with Buxus, Phillyreas, Skimmias, and Veronicas, with Ivies as trailers. Where bulbs are used, care should be taken in making the selection, that the varieties planted will afford a succession of bloom—a not difficult matter. Some of the more useful bulbs are Snowdrops, Crocus, Scillas, Hyacinths, Chionodoxas, Tulips, and Narcissus. Another arrangement may consist of Wallflowers and Stocks, either mixed with shrubs or in masses, with an edging of alpine Auriculas, Primroses, or Daisies.

DAHLIAS.—Cut these down to within 4 or 5 inches of the ground, treating them similarly to the Begonias, and before putting them away in their winter quarters, laying them on their side for the present, and make the labels fast on the stems.

LOBELIA CARDINALIS should be lifted carefully, and stored in boxes of light soil. Keep them cool and dryish, but not dust-dry, or they will waste away with a kind of dry-rot.

HINTS IN GENERAL.—The work of clearing the flower-beds should be persevered with when the state of the weather will permit. Before digging the beds, they should have a moderate dressing of rotten manure, well mixed with the soil if they are to be filled with the usual spring flowering bedders. Where the edgings of Pyrethrum parthenifolium aureum are still in good condition, it will suffice to trim them neatly, making them of one uniform width. The transplanting and planting of shrubs and trees may be pushed on with, and all vacant beds should be manured and dug, leaving the soil in a fairly rough state.

FRUITS UNDER GLASS.

By Bailey Wadds, *Gardener, Birdsall Gardens, York.*

KEEPING GRAPES.—Good attention should now be given to those Grapes which will have to be kept for spring supply. For this purpose, Muscat of Alexandria, Black Alicante, Lady Downes, and West's St. Peter's, in the order named, are the best. The bunches are best if they remain on the Vines till early in January, at which time they should be cut with a long piece of the shoot attached, and placed in bottles of water in a cool room, where by preference there is no other fruit. By deferring cutting till January, the stalks do not shrivel so quickly as when they are removed earlier; especially is this true of Muscat of Alexandria. The footstalks of the bunches of this Grape are tender, and do not want handling much after they are cut; and when the fruit is perfectly ripe, not nearly so much water is absorbed as by bunches of Black Alicante. It is the best late-ripening Grape, the berries continuing to acquire colour so long as there are leaves on the Vine. The bunches of Muscats should be carefully examined on alternate days for decaying berries; and in removing these, the sound berries should be carefully preserved from injury from the point of the scissors, and the stalks should not be twisted. A pointed bit of stick may be used in extracting the decayed or mouldy berries, it being less injurious to the appearance of the berries than the tips of the fingers. November is the worst month in the year for the Grapes, owing to fogs and dampness. The bunches of Black Hamburgh Grapes, if still on

the Vines, will require careful attention, if they must be kept till Christmas, the skin of well-ripened berries being very tender, and quickly affected by damp. Still, they may be kept in good condition till January by means of good ventilation, and by not allowing condensed moisture to drip on to them from the glass. The temperature of a vinery in which Grapes are hanging should not fall below 42°, and air should be afforded by the top ventilators at all times except during severe frost. Keep the temperature at 50 to 55° during the day, with abundance of air. The heating apparatus may be used on alternate days. In the Grape-room the bottles in which the Grapes are placed will require filling twice a week, taking care not to spill the water about the floor in doing so. A large pan is useful to stand the bottles in when filling them, and all moisture should be dried up on completing the job. Plenty of ventilation by means of doors and windows, with fire-heat frequently, are required to keep the Grapes in good condition. In moist districts, if the Grapes must hang on the Vines till the New Year, outside borders should be protected with shutters or tarpaulin.

THE EARLY VINERY, if the Vines were pruned, and everything made ready for a start, may now be closed, but no fire-heat will be needed for a fortnight, although the gentle warmth afforded by a bed of leaves and stable-litter placed in the middle of the house will be useful in exciting the Vines. This bed ought to be made on a thick wooden platform. The temperature may be kept at about 55° till the buds break, then an increase of 5° to 10° may be given by fire-heat. The tops of the rods may be lowered to the middle of the house to afford the buds on the lower half a chance of starting simultaneously with the others. Damp the Vines daily with tepid water, and cover the border if outwith a bed of dry litter 18 inches thick; and see that all drains and water-spouts are in perfect order.

THE ORCHID HOUSES.

By W. H. White, *Orchid Grower, Burford, Dorking.*

CATTLEYA LABIATA.—The beautiful autumn-flowering varieties of Cattleya labiata are great favourites, and for cut bloom they are admirable. Of the few species of Orchids which bloom at the present season, the labiatas are undoubtedly the best; and now that so many of the plants are in or passing out of flower, the importance of removing the spikes and flower-sheaths from the plants may be urged upon cultivators. This removal should take place at the same time that the blooms are taken, as if delayed, moisture accumulates at the base of the sheath, the leaves become spotted and fall off, and the new pseudobulbs frequently decay, and maybe the plant is also lost. To preserve plants thus affected, the decaying parts should be cut off without delay. If decay comes from excess of water at the roots, the health of the plant is injured, and in any case a drier atmosphere should be afforded as the best means of arresting decay. Healthy plants after flowering may be placed in the coolest and best-ventilated part of the Cattleya-house, and be kept there during their long period of rest. During the winter, water at the root is only necessary at long intervals of time, sufficient being applied to keep the pseudobulbs plump, the object being to induce free growth of the roots, and yet to prevent premature growth. As regards repotting, those plants which require a larger pot should have their needs attended to so soon as the new roots are observed to be pushing from the base of the current season's growth; but if they are past that stage, repotting had better be postponed till there is a return of activity. The earlier-flowering C. l. var. Gaskelliana, although its roots are growing and extending, should not be disturbed by repotting it at this season, but in the spring when the new breaks will appear.

OTHER SPECIES OF CATTLEYA.—Among those that require some special kind of attention in the autumn is C. Lawrenceana, a species that is late in starting to grow, and owing to lack of sunlight and natural heat, makes comparatively slow progress. It is important that each plant should be so placed as to be exposed to all the sunlight possible, large specimens being elevated till their leaves are within a few inches of the roof-glass, and small plants suspended by wire from the roof. The warmest part of the Cattleya-house is the best place for them, as the young breaks are apt to decay if much water is afforded the plants at this season—a good deal of discretion must be used in affording it. When full development has taken place, but very little will be needed to keep the pseudobulbs plump; an increased quantity being applied when the flower-sheaths show. When the flowers are fully expanded, the quantity of water may be again gradually curtailed till no more is required than will prevent shrivelling. Plants of C. Percivalliana having completed the growth of their pseudobulbs, should be kept moderately dry at the root, over-dryness causing either abortive flowering or deformed flowers. This species should also be well raised up to the light at all seasons. A very desirable Cattleya now in flower is C. Bowringiana, whose blooms, though small, are richly coloured, and like the autumn-flowering C. labiata, it is a very free-flowering species, whose large spikes have a pleasing appearance by artificial light. It is a plant of easy culture. In a few weeks from the present time quantities of new roots will be seen pushing from the base of the pseudobulbs now flowering, and then is the best time to repot any of the plants that may require more space or fresh materials. Another nice autumn-flowering Orchid is Lælia Perrinii, but which many persons have discarded because its blooms are short-lived; when the plant has passed out of flower, a long rest, with but little root-moisture, should be afforded it.

THE HARDY FRUIT GARDEN.

By T. Turton, *Gardener, Maiden Erlegh, Reading.*

MAKING PLANTATIONS OF RASPBERRIES.—Ordinary garden land, if prepared as advised in a former Calendar, will now be settled and in a fit state for planting. Advantage should be taken to get the setting out of the Raspberry plants finished before colder weather sets in, autumn-planted Raspberries doing better the first season than spring-planted. However, where the land is of a stiff nature, it will be better to lay it up as roughly as possible, and the planting performed from the middle of January to the middle of the next month. Where Raspberry canes are to be secured to wire fences, the rows should be not less than 6 feet apart, the canes being planted 18 inches apart, two canes being laid in from each stool. Where stakes are used, I consider that these form the best kind of support for being readily removable. A new plantation can be formed when the old ones are worn out without incurring expense. For this method of securing the fruiting canes, the plant should stand 6 feet apart from row to row, and 4 feet apart in the row, stakes being placed midway between the plants in the rows; if the plants stand triangularwise, they will have the greater amount of space for the development of the young canes. Tie loosely the young canes to the stakes for the present. Before frosts occur mulch the land with stable dung, &c.

SMALL FRUIT: FRUIT BUSHES.—Where the Currant and Gooseberry quarter is adjacent to a farmyard, the stables, or other places which afford a harbour for sparrows, the pruning of the bushes should be speedily completed, and the buds made distasteful to the sparrow and birds generally, by syringing them with a whitewash made from freshly-slaked lime and fresh soot. It will be necessary before using this wash, to pass it through a sieve, with a very fine mesh. Unlike the bullfinch, which does not usually begin to destroy the buds till early in the new year, the sparrow is suspected from the end of the month of October, and delay in pruning and dressing will result in the loss of a large number of the buds, the Red and White Currants being the first kinds attacked. In pruning the bushes of these fruits, a few young shoots should be left each year for taking the places of old or cankered branches. Experience only can teach the pruner how to prune Gooseberries to the best advantage, as the different varieties should be differently pruned; but some of the old branches should be cut out of all of them, or they become so crowded that the gathering of the fruit in the middle of the bush becomes a matter of difficulty. Upright growers, like Whitesmith, Champagne, &c., after pruning back to the best-placed young shoots, should have the side-shoots spurred-in to 1 inch or less in length. The Red Warrington and others of a more or less pendulous habit may be pruned-back to well-placed young shoots if the bushes are sufficiently large, shortening these slightly to a bud on the upper side of the shoot. Cuttings of Gooseberries and Currants may be made and put in on a border. Cuttings should be made from straight, well-ripened, firm shoots at least 12 inches long, and which have been taken off close to the old wood, but avoiding the actual base of the shoot, as that part is full of dormant buds. Leave four buds near the top of the cutting to furnish shoots, and cut out the rest, buds left underground causing suckers to push up. The cuttings should have the upper part dipped in warm fresh lime-wash, to protect the buds from the birds. Place the cuttings 6 inches apart in rows 1 foot apart, and let the base of the cuttings be 6 inches below the surface of the soil. Make the ground firm, and apply a mulch of decayed tree-leaves of some kind before frosts occur.

PLANTS UNDER GLASS.

By J. F. McLeod, *Gardener, Dover House, Roehampton, S.W.*

MIGNONETTE.—Shift any young plants now growing in 3-inch pots into 5-inch ones, using a rich friable loam in which mortar-rubbish and charcoal are freely incorporated with a small quantity of sand, and passing it all through a ½-inch sieve. In potting, press the fresh soil somewhat firmly about the old ball, so that a stout robust growth may be fostered, instead of a weak, lanky one; and employ small sticks as directed in a previous calendar. Let the pots stand near the glass roof in a cool greenhouse.

PERPETUAL OR TREE CARNATIONS.—These plants should now be supplying numbers of flowers for cuttings, and beyond tying up straggling shoots, and keeping the plants free from aphis, little more can be done. Air should be afforded liberally, and the pots stood upon some such materials as shingle, gravel, coal-ashes, &c., a very slight heat being afforded in the pipes in cold weather. Young plants to flower later should be pushed on rapidly, but maintaining strong growth by carefully affording farmyard manure-water once a week, and by way of change some other kind of manure. Syringing these Carnations overhead may still be practised twice daily, but should frost set in, then once a day will suffice, and this only in the early forenoon, when a bright day is anticipated. Attend to the necessary sticking of the plants, and the removal of all decayed leaves.

THE FORCING HOUSE.—A succession of flowering plants should be kept up by the introduction at intervals, and as occasion demands, of the various subjects usually in demand at this season, such as Indian Azaleas, which force readily when the growth has been well ripened, and the buds are in consequence rather forward. A forcing-house should be kept at a brisk heat with a humid atmosphere, otherwise disappointment may be expected. Crowns of Lily of the Valley should be placed in a propagating case or some such place, where they can be readily covered over, treating them like Seakale crowns, till the flower-spike is about ⅔ inch long, when a gradual inuring to the light should take place. It is well, if the flowers be not wanted immediately, to transfer the boxes of crowns, &c., to some cooler place, where the flowers will last in nice condition much longer than would otherwise be the case.

CANNAS.—These plants will now be sufficiently ripened to admit of water being withheld altogether from the roots, and the pots containing them may be laid on their sides on a shelf in a cool greenhouse where they will not be reached by frost.

FUCHSIAS.—Water may also be withheld in the case of plants which flowered in the early part of the summer, and the growth is now mature. The same kind of quarters as that recommended for the Cannas will suit these plants.

THE KITCHEN GARDEN

By Arthur Coombes, *Gardener, Himley Hall, Dudley.*

DIGGING AND TRENCHING.—The recent heavy rains have thoroughly moistened the soil, but digging may not be done on any soil that is in a pasty condition, heavy land needing great care in this respect. Unless the subsoil is of good quality, bastard-trenching is best, the subsoil being broken up with a digging-fork, but left at the bottom. During the progress of the work, partly rotten dung, tree leaves, and garden refuse, may be shovelled into the trenches of a regular thickness, covering this with a good thick layer of the upper crust, skimmed off with the spade. Always dig the top-soil in thin spits, and do not break them up, the frost penetrating the soil to a greater extent if the clods are rough and whole. As far as possible, manure should be applied to heavy soils at this season, but on light ones it is best withheld till the spring, except on plots intended for Onions, Carrots, and other deep-rooting plants.

GLOBE ARTICHOKES.—Having forked into the soil a dressing of rotten manure, it will now be necessary to protect the plants from frost, by surrounding each plant with a small mound of stable-litter or tree leaves, not unduly pressing against the plants, and excluding all light and air from them, or decay of the heart-leaves will result.

EDITORIAL NOTICES.

Advertisements should be sent to the PUBLISHER.

Illustrations.—*The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, Nov. 13 — Royal Horticultural Society's Committees at the Drill Hall, James Street, Westminster.

WEDNESDAY, Nov. 14—East Anglia Horticultural Club.

SHOWS.

SUNDAY, Nov. 11 — Royal Agricultural and Botanical Society of Ghent, Belgium (two days).

TUESDAY, Nov. 13 — Kingston and Surbiton. West of England, at Plymouth (two days). Southampton (two days). Farnham (two days). Kidderminster.

WEDNESDAY, Nov. 14 — York Florists (three days). Windsor, Eton, and District. Hertford Horticultural. Hull and East Riding (two days). Birmingham (two days). South Shields (two days). Rugby (two days). Bristol (two days).

THURSDAY, Nov. 15 — Edinburgh (three days). Winchester (two days). Birkenhead. Bolton (two days). Chesterfield (two days). Bradford (two days).

FRIDAY, Nov. 16—Sheffield (two days).

SALES.

MONDAY, Nov. 12 — Important Unreserved Sale of Nursery Stock, at the Ottershaw Nurseries, near Chertsey, by order of Messrs. Fletcher Bros., by Protheroe & Morris (four days). Special Sale of 10,000 Hardy Perennials, Carnations, &c., at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

TUESDAY, Nov. 13 — Dutch Bulbs, at Protheroe & Morris' Rooms. Imported and Established Orchids, at Protheroe & Morris' Rooms.

WEDNESDAY, Nov. 14 — Japanese Lilies, Roses, &c., at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

THURSDAY, Nov. 15 — Continental Plants, Roses, Palms, &c., at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

FRIDAY, Nov. 16 — Orchids, from Messrs. Linden, Brussels, at Protheroe & Morris' Rooms. Dutch Bulbs, at Protheroe & Morris' Rooms.

SATURDAY, Nov. 17 — Dutch Bulbs, at Protheroe and Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—42°.4.

"False Crosses" in Strawberries.

It is a common experience among hybridisers that, although every care be taken to prevent the access of a flower's own pollen, yet the resulting seedlings show little or nothing of a crossed origin, but resemble almost entirely one or other of their parents. As an illustration, we may refer to the experiments made by Mr. Grieve and others to cross the Zonal Pelargonium with the wild Geranium pratense. The seedlings so raised that we have seen, have been almost identical with the last-named plant, though there has sometimes been a mere trace of variation. In connection with this subject M. A. Millardet has published a *Note sur l'Hybridation sans croisement, ou fausse hybridation* in *Les Mémoires de la Société des Sciences physiques et naturelles de Bordeaux*, t. iv. (4e Série). He proposes these terms to indicate the result when the progeny of cross-fertilisation resembles almost, if not entirely, one or other of the parents. He finds this to be the rule in Strawberries, among which crosses and hybrids resemble most often the maternal type, as the following examples show:—

Fraisier des quatre saisons blanc, à coulants × *Chili velu.*—This gave four hybrids, one exactly resembled the mother, excepting in the fruits being red; the three others reproduced completely the paternal type.

Black Hautbois × *Globe.*—This gave fifteen hybrids; of which fourteen reproduced the maternal characters, one only resembled the father.

Black Hautbois × *Chili velu.*—Eight hybrids were obtained, all reproduced the maternal type.

Black Hautbois × *Gaillon rouge.*—Ten hybrids resulted, all being exactly like the mother. The seed of one of these hybrids gave two plants at the second generation, one of which—the sole example met with—reproduced the paternal characters.

These will be sufficient to show the general character of the experiments.

Although, as we have said, earlier experimenters have met with somewhat similar results with other flowers, it was suspected that accidental pollination had supervened, or even that parthenogenesis had taken place. But, as the author says, this is the first time to his knowledge that this fact is established in a positive manner. He alludes to the experiences of Herbert and Parkman, and adds, "but if one had sometimes recorded the entire reproduction of the maternal characters in hybridisation, that of the paternal had escaped all observation." Referring to Mr. F. Parkman's paper on "The Hybridisation of Lilies" (*Gardeners' Chronicle*, January 5, 1878), his results seem to have been quite as pronounced as M. Millardet's, as far as the reproduction in the hybrids of the maternal characters is concerned; for he also found that very many seedlings resembled the mothers. It is not always that all the offspring of a seed-vessel resembles the mother, for while the majority may do so, one or more may be true hybrids. Thus, Mr. Parkman describes the production of a fine hybrid Lilium speciosum × auratum (figured in *Florist and Pomologist*, March, 1876); while of fifty seedlings from the same pod, forty-nine resembled speciosum. Similarly, Mr. P. N. Don, describing two hybrids in the *Gardeners' Journal*, 1847, p. 615, speaking of Begonias, he says:—"The two following varieties (B. prolifera and B. hybrida) were raised from seed of B. manicata × B. coccinea. A fact worthy of notice is, that from one seed-pod the species manicata (the maternal type), and the two hybrids were all raised in great numbers—a proof that the pollen did not effect a change in the whole of the seeds, which is not easily accounted for, as the whole of the male flowers were taken off B. manicata before the time of crossing, and continually removed as they appeared, until the pod began to swell, and no others were in the house at the time."

M. Millardet gives no instance of this kind. In one case only, quoted above, did a plant of the second generation revert to the paternal type. Making a summary of his results, we find that of forty-four of these so-called "false hybrids," or "hybrids without crossing," thirty-eight reproduced the maternal characters, and six the paternal. Of eight other cases, the offspring were all after the maternal type in both first and second generations.

Of Mr. Veitch's hybrid Rhododendrons among East-Indian species, studied by Mr. Henslow, when a composite hybrid was crossed by a true species, the latter mostly overpowered the maternal form completely in the offspring; thus, when Hippolyta, a hybrid containing four species, and one of them twice was crossed with R. multicolor var. Curtisii, the result was similar to the male parent. Similarly, Monarch, a large-flowered hybrid, containing five species, and one of them twice, was crossed with the small-blossoming R. malayanum, and the result was R. malayanum.

M. Millardet refers to Naudin's experiments, in one of which he crossed Datura Stramonium by D. ceratocaula, and obtained two fertile plants only differing from the mother in size. Their seeds also produced D. Stramonium. On the other hand, D. lævis × Stramonium gave 40 plants, which only differed from the male parent in size and a diminution of the spines on a certain number of fruits. Of four individuals resulting from their seeds, which had fertilised one another, three resembled the father, one the mother.

The author concludes his paper by discussing the question how far the localisation of the parental characters can be traced in the cellular structure of the hybrid. He shows how in Vine crosses the different forms of the stomata reveal separately their origins respectively; while intermediate forms are mixed with them, very much the same results were found by Mr. M. Macfarlane in other plants (see *Gardeners' Chronicle*, 1893, March 28).

Mr. Henslow has, we believe, endeavoured to trace similar combinations of microscopic differences in several of Mr. Veitch's hybrid Rhododendrons referred to above, but, with rare exceptions, they gave only negative results.

Waterfall at Stephen's Green.—The artificial rockwork depicted in the illustration (fig. 74) affords an excellent and characteristic bit of the handiwork of the veteran Mr. Pulham, Broxbourne, Herts. His work, when dealing with artificial materials, which is usually massive in appearance, has a close resemblance to natural sandstone, in its imitation of cleavage, stratification, and colour; and, what is of more consequence to the gardener, the materials of which it consists are of such a nature that most plants succeed on it, provided the soil in which they are to grow is suited to the plants' needs. The photograph from which our engraving was taken was kindly sent us by Mr. W. Sheppard, who has done much in laying-out recently public gardens and parks in the Irish metropolis. (See *ante*, p. 100, July 28 last.)

Royal Horticultural Society.—At the next meeting of this Society, which takes place in the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday next, the 13th inst., special prizes are offered for Chrysanthemums, and a large show of these flowers is anticipated. At 3 P.M., a lecture on "Chrysanthemums" will be given by Mr. C. E. Shea, F.R.H.S.

Linnean Society.—At the meeting of this society on Thursday, November 1, Mr. C. B. Clarke, F.R.S., President, in the chair, Messrs. Arthur P. Green and F. Lewis were elected Fellows. Mr. Alexander White was admitted. Messrs. H. & J. Groves exhibited an undescribed Chara from Westmeath, and made remarks upon its peculiar mode of growth. Mr. J. O. Tepper exhibited photographs of a new and remarkable Fungus from South Australia, which explained the formation of the peculiar stone-like nodules occasionally found when clearing scrub-land. These were found to be due to the agglutinating nature of the mycelium of this fungus, the grains being permanently cemented by lime and ferruginous oxides. The Rev. G. Henslow made some remarks on a peculiar mode of propagation of Oxalis cernua, observed in Malta, and exhibited some views taken during his sojourn there.

Mr. Miller Christy exhibited a long piece of leaden pipe which had been gnawed through its entire length by rats, in a manner which showed that the object was not, as generally supposed, to get access to water. Mr. E. M. Holmes exhibited some curious plants from Japan. On behalf of Mr. A. W. Waters, a paper was then read "On Mediterranean and New Zealand Retipora, and on a Fenestrate Bryozoan;" and on behalf of Dr. J. Müller, a paper on "Lichens in the Kew Herbarium."

—— On the occasion of the meeting to be held on the evening of November 15, 1894, at 8 o'clock, papers to be read are:—1, A Revision of the British Copepoda, belonging to the two Genera, Bradya and Ectinosoma, by Thos. Scott, F.L.S.; and 2, Recent Observations on the plant yielding Bhang (Cannabis sativa), by Dr. D. Prain, F.L.S.

Lindley Library.—The subscriptions received or promised up to the present, amount to about £70, too small a sum to warrant the printing of the catalogue. Among recent subscribers we note the Bentham Trustees £5 5*s*; W. P. Burkenshaw, Esq., 10*s*.; Captain Pakenham Mahon, £1; W. E. Gumbleton, Esq., £1 1*s*.; W. M. Appleton, Esq., 5*s*.; and trust that we may speedily be able to announce further contributions.

Royal Horticultural Society of Ireland.—At the annual Chrysanthemum and Fruit Show, to be held at Ball's Bridge, Dublin, on November 14 and 15, the Council have decided to allot space for the display of horticultural appliances and sundries. The ample space available at the Ball's Bridge premises enables the Society to bring before horticulturists and the public generally many of the appliances which modern progress has provided. No charge will be made for space, but early application must be made to the secretary, at the office of the Society, 15, Lower Sackville Street,

Fig. 74.—WATERFALL, STEPHEN'S GREEN, DUBLIN. (see p. 568)

Official Catalogue of the National Chrysanthemum Society.—We have received the new official catalogue of the National Chrysanthemum Society, which forms the second supplement to the centenary edition of the hitherto standard list of Chrysanthemums cultivated in this country. This supplement has been mainly called for by the large number of new varieties which have been sent out since the publication of the first supplement in 1892, and the changes in the positions occupied by the leading show varieties; and it will supersede all previous lists so far as judges and exhibitors of Chrysanthemums are concerned. The compilers remark that all the varieties included in the two previous supplemental lists are incorporated in an alphabetical list to be found at the end of the present one, together with the novelties of last season, and such of those for the current year as were exhibited in promising form at the Floral Committee meetings of the National Chrysanthemum Society this season. The novelties of 1894 being very numerous, and as yet untested for the most part, are not included. The hope is expressed of the publication of an entirely new revision of the Society's list, and its re-issue in one volume. The names of Messrs. W. Herbert Fowler, E. C. Jukes, H. J. Jones, A. Taylor, C. Harman Payne, are a sufficient guarantee for the thoroughness and intelligence with which the present issue has been prepared. We note the preponderance of French names given to the flowers, which of itself points to the almost uncontested superiority of Frenchmen in the raising of new flowers, and the overwhelming number of the so-called Japanese varieties. In a new edition, we should be glad to see the colours of all varieties mentioned, and the section to which they belong indicated in the usual manner, as by so doing the list would be more valuable for purpose of reference than it at present is.

Stowmarket Horticultural Class.—The East Suffolk County Council Technical Instruction Committee have appointed Charles Berry, Gardener, Goldrood, Ipswich, to give a course of ten

lectures upon "How to Cultivate the Cottage Garden and Allotment," the first of which he gave on Friday evening, November 2, at the Working Men's Room, Stowmarket, the subject treated being "The Apple." The lecture was illustrated by diagrams, and was attentively listened to throughout. We understand that Mr. Berry's services are very much appreciated.

North of Scotland Root, Fruit, and Vegetable Association.—The twenty-fourth annual exhibition of this Association was held at Inverurie, N.B., on Saturday, the 3rd inst. There was a decrease all over, but principally in fruit and Potatos, of about 100 entries as compared with 1893, when the entries numbered 735, as against 630 on Saturday last. But looking to the character of the season as affecting the fruit crop, and the deficiency that exists in both the Turnip and the Potato crops, it was surprising to find not only such a large exhibition of those products, but that the quality was of such a high standard.

Is the Tomato a "Fruit" or a "Vegetable"?—We and our colleagues of the Press are often called on to give an opinion on this subject in reference to disputed interpretation of flower-show schedules. For our own parts, we say that while the Tomato is botanically a fruit, its use in gardening is almost entirely that of a "vegetable," and hence it should, for garden purposes, be so classed. Latterly, however, the introduction of dessert-Tomatos has introduced a fresh source of confusion; but the case is so exceptional, that we do not think it need invalidate our statement. The following extract from Bailey's *Annals of Horticulture* (U.S.) for 1893 shows that an American judge takes the same view as ourselves, and lays down the law accordingly:—"There being no evidence," says the judge, "that the words 'fruits' and 'vegetables' have acquired any special meaning in trade or commerce, they must receive their ordinary meaning. . . . . Botanically speaking, Tomatos are the fruit of the Vine, just as are Cucumbers, Squashes, Beans, and Peas. [! !] But in the common language of the people, whether sellers or consumers of provisions, all these are vegetables, which are grown in kitchen gardens, and which, whether eaten cooked or raw, are, like Potatos, Carrots, Parsnips, Turnips, Beets, Cauliflower, Cabbage, Celery, and Lettuce, usually served at dinner in, with, or after the soup, fish, or meats which constitute the principal parts of the repast, and not, like fruits generally, as dessert. The attempt to class Tomatos as fruit is not unlike a recent attempt to class Beans as seeds, of which Mr. Justice Bradley, speaking for this court, said:—'We do not see why they should be classed as seeds any more than Walnuts should be so classified. Both are seeds in the language of botany or natural history, but not in commerce or in common parlance. On the other hand, in speaking generally of provisions, Beans may well be included under the term 'vegetables.' As an article of food on our tables, whether baked or boiled, or forming the basis of soup, they are used as a vegetable, as well when ripe as when green. This is the principal use to which they are put.'" It is very amusing to see the use of the word "Vine" in this connection. On this side of the Atlantic, we should never say that Tomatos or Vegetable Marrows grew on Vines! Our American cousins use the word vine in a very broad sense to include all herbaceous stems that are more or less trailing or climbing.

Horticultural Travelling Structures at the Antwerp Exhibition.—It may be of interest for our readers to learn that the new travelling hot-houses, which run on wheels and rails, and which were recently noticed in these pages, have been awarded the only prize medal given to British horticultural buildings.

Dahlias.—Messrs. Dobbie & Co., of Rothesay, send us a photograph of their Dahlia grounds, which show how extensive are their collections, and how well cultivated. The single Dahlias in the view before us are particularly well represented.

South Birmingham Gardeners' Association.—On November 1, Mr. Q. Read, the Assistant Gardening Instructor for the county of Worcestershire, delivered a lecture on "The Eucharis," before the members of the above society, Mr. G. Fawdry presiding. It was an excellent and comprehensive lecture on an interesting plant, and a profitable discussion followed its reading.

Ayrshire Gardeners' Mutual Improvement Association.—The first fortnightly meeting of the fourth session of the Association was held in the Carrick Street Hall, Ayr, on Thursday evening, November 1, Mr. MacConnochie, Doonside Gardens, in the chair. An interesting paper was read by Mr. A. H. Scott, Cambusdoon Gardens, entitled "Horticulturists, Past and Present: Advantages, and Disadvantages." The Chairman intimated that the next meeting would take place on Thursday evening, November 15, when the subject for discussion would be, "Canker; its Cause and Cure." A vote of thanks to Mr. MacConnochie for presiding brought the meeting to a close.

Notes on this Season's Crop of Vegetable and Flower Seeds at Erfurt.—At the end of June continuous rainfall began, accompanied with cold days and nights, which were not without a detrimental influence upon the crops. Cauliflowers, which were doing well until then, became sickly, and the crop was below average. Cabbage-Lettuces, with the exception of the earlier sorts, all sickened, owing to the rainfall; and Cucumbers, which stood it very well, ultimately became unhealthy, and will give but a small seed crop, with the exception of the Japanese climbing Cucumber, which has again done very well. Rampion, Peas, white and red Cabbage, Kohl Rabi, Borecole, garden Turnips, and Beetroots, small early Radishes, Spanish Radishes and Onions, as well as large-rooted Chicory and Parsley, and large-rooted Carrots, yielded a good crop, whilst short-rooted Carrots and Celery gave only an average crop. Runner Kidney Beans are fuller of fruit than they have been for several years, but they need for ripening, dry weather, as do also the Leeks. Early Dwarf Kidney Beans yielded only a small crop. All summer-flowering plants (annuals) stood exceedingly well, but the crop might have been better. The seed crop of Wallflowers is good, but that of China Asters bad. Pinks and Pansies gave a good crop. Phloxes and other annuals were much spoilt by the rain. Speaking generally, the crop of 1894 was better than that of 1893, as will be proved by the much lower prices asked for seed. Amongst the Erfurt novelties of this year a frame Cucumber is prominent, which is the most fertile of all, and besides this a very long enduring; it is named "Ideal Gurke." Amongst the annuals, a Wallflower, "Excelsior," reaching over 2 feet (70 cm.) in height. Terra cotta-coloured China Aster, a new salmon-coloured Pink, as also a Tea-Rose-smelling Begonia, are remarkable. *U. D.*

Notices of Books.

"Flora of Mount Desert Island." *

Messrs. E. L. Rand and J. H. Redfield, utilising the labours of their predecessors, and drawing largely on their own resources, have compiled a catalogue of the plants growing on Mount Desert and the adjoining islands, prefacing it with some interesting remarks on the distribution of plants, and illustrating it with an excellent map. Mr. W. M. Davis has also contributed a chapter on the geological features of the island. The plants enumerated number 680 species of flowering plants and 606 Cryptogams.

Mount Desert Island, lies about 110 miles east of Portland, on the coast of Maine, and less than half that distance from Rockland, on the western shore of Penobscott Bay. Its area is about 100 square miles, its greatest length about 15, its greatest breadth rather less. A range of granite hills runs from west to east across the island, varying in elevation from 600 to 1500 feet. The general character of its flora is strongly northern and even arctic—essentially Canadian. In drawing up their list, it is a happiness to find that the authors have followed the nomenclature of the sixth edition of *Gray's Manual*, and have not been led away by the specious purism of some of their compatriots. With relation to this matter, we find the following passage, which may interest some of our readers:—"The worst of the whole matter is, that the horticulturists are dealing sensibly with facts as they find them, while the botanists are driving with theories to annihilate facts. It is hard enough, as anybody of experience knows, to make a horticulturist adopt a change in nomenclature made necessary for scientific reasons; but how impossible it would be to force upon him a change made merely to carry out a theory or a system of questionable expediency. What can be gained by intensifying this distinction between botanical and horticultural nomenclature, especially now that the horticulturists have refused to follow the Rochester code on the practical ground that it does not recognise the well-established principles of property, right, custom, usage, and the salutary maxim *quieta non movere*."

This excessive purism in nomenclature appears to us very much of a waste of energy. The neo-nomenclaturists would surely benefit science much more if they devoted their energies to the discrimination of the plants they write about, and to the discussion of the many problems connected with them. It is like wrangling over the titles on the backs of books, while the contents of the volume are not looked at. It seems to us more practically useful to adopt the plan followed by the great law-givers and monographers, and to relegate all questions as to history and synonymy to the paragraphs devoted to those subjects. Our authors even make some concession. For instance, they write Coptis trifolia (L.) Salisbury, but Linnæus' name for the plant was Helleborus trifolius, and, so we are told, that the (L.) in parenthesis applies merely to the specific, and not to the generic name. The plan adopted by our authors does not tell us to what genus Linnæus assigned the plant. Surely it would be much simpler and more accurate to write Coptis trifolia, Salisbury, and where necessary to add *syn.* Helleborus trifolius, Linn. There is no reason to encumber the adopted name with details of history or synonymy, better set forth elsewhere. The remarks already made will indicate the general nature of the Flora. The list is well got up, and very interesting from the point of view of botanical geography.

* Cambridge, Mass.: John Wilson & Son, 8vo, pp. 286.

Amateurs' Handbook on Gardening.

As is not well explained by its title, this small manual contains articles by experts on several of the various kinds of garden flowers, in the cultivation of which amateurs interest themselves, and thus supply information not readily accessible in small gardening works. The different articles may be taken to be as good of their kind as is possible within the limits of an octavo volume of 194 pages. We note as contributors to its pages, Messrs. J. Douglas, J. Laing, J. Hudson, R. Parker, and the Rev. H. H. D'Ombrain. The useful information imparted by these writers would be more readily available if a proper index were supplied in the next edition, in place of the present synopsis of the contents of the book. Messrs. Blake & Mackenzie, Liverpool, publish the book at 2*s.* 6*d.* nett.

Curious Fern Prothallus.

This prothallus, which is abnormally large, so that its peculiarities are quite distinct to unaided vision, has originated in a sowing of Athyrium f.-f. plumosum, Druery, in which most of the prothalli produced have failed to yield plants, and ultimately perished. A portion of this has turned brown, but after remaining dormant for several months, it was observed to be producing two very distinct horns, upon each of which an incipient bud or bulbil speedily made its appearance, as depicted (fig. 75). At

present (September 22) these bulbils are as large as Mustard seeds, and evidently commencing to develop fronds. From their position, which is far removed from the usual sites of archegonia, of which, moreover, no signs preceded the appearance of the bulbils, they are undoubtedly asexual or apogamous, but showing that phenomenon in, I believe, a much distincter form than hitherto.

Until the plants show their parentage, their origin cannot with certainty be determined, but it is worthy of remark that the presumed parent (Athyrium f.-f. p., Druery) bears bulbils seated in the sori, and, as recently observed, produces a small percentage of very large spores, at least four times the normal size, of those associated with them. This is not mentioned as necessarily bearing upon the phenomenon described, but merely recorded in connection with it *pro tem.*

NURSERY NOTES.

CHRYSANTHEMUMS AND FRUIT TREES AT NOTTINGHAM.

Established upwards of a century ago, the firm of Messrs. J. R. Pearson & Sons, Chilwell, near Nottingham, has long sustained a wide reputation for the culture of Pelargoniums, Chrysanthemums, fruit trees, and general nursery stock, and particularly in the midland counties, the firm has acquired a very large business, later developments having been largely in the fruit department, where the number of trees raised for sale has become larger year by year. In these days of rapid locomotion a Londoner has but little difficulty in visiting a nursery a hundred and twenty miles distant and returning to town the same day, and so, after visiting many of the collections of Chrysanthemums around town, we travelled by express train from St. Pancras to Nottingham on a bright morning about a week ago, primarily in the hope that a few notes taken in the nurseries at Chilwell would prove of considerable interest to many of the readers of this journal, and also to satisfy ourselves as to what is being done by this energetic firm at home. Arriving at Beeston station about three miles out of Nottingham, we were met by Mr. A. H. Pearson, who drove us through the village of Beeston, past the premises of the horticultural engineers, Messrs. Foster & Pearson, to the original home of the nurseries, where all the glass is erected, the fruit-grounds being three-quarters of a mile or more further along in the smaller village of Chilwell. Of the glass department, Mr. C. E. Pearson is the manager, and in his company we proceeded to see at once this department of the business. Most of the houses are thoroughly well built, and are useful for large plants, or for fruit-growing, but are much larger than the usual nursery houses, and rather higher in some instances than such plants as occupy them at the present time require. It is interesting to compare with the modern erections, a very old house that was built when the late Mr. Pearson was quite a boy, as showing the more intelligent knowledge we have now regarding the requirements of plants, resulting in a much less quantity of rafter wood being employed, and in the substitution of large panes of glass in the place of the minute system of glazing then prevalent. These old houses, however, were undoubtedly built to stand a very long time. Orchids though grown for sale in some little quantity, are more used for the supply of cut blooms than anything else, and they would be of little use for such a purpose unless they were well grown. A good-sized collection of Cœlogyne cristata and its varieties leave nothing to be desired in this respect, the finished pseudobulbs being exceptionally large and good, and young flower-sheaths have appeared among them in profusion. As illustrating the strength of the bulbs, it is stated that in some instances last season the spikes produced nine blooms of good character. Cypripediums, Selenipediums, Cymbidium eburneum are all prized for the quantity of bloom they afford; and some plants of Dendrobium Phalænopsis Schroderianum in flower are equally happy, whilst D. nobile had made remarkably strong bulbs. The large span vinery, with a good crop of Grapes still hanging, has a pretty appearance, due in no small measure to two trellises in the shape of a ridge on either side of the house, and covered with Adiantums in pots, where they do very well indeed.

This is not the best time to see the display of Zonal Pelargoniums, the chief show of these being made during the summer months, owing to the less favourable climatic conditions of Nottinghamshire thwarting any effort to keep such displays in the heart of the winter as are familiar in the South. Two varieties, however, deserve mention, and one of these is Enid, a first-rate scarlet seedling of the less dazzling type; the flowers are very large, and of good shape. Gertrude Pearson is the other one, and is as fine a pink variety as any yet introduced. But the principal interest in the houses at the present is the collection of Chrysanthemums, which, it is rather surprising to say, appear to be little later than the collections nearer home. A large show is made each year in an extensive span-house, which this season was opened to visitors on the 1st inst. for a period of about three weeks. The plants are so arranged that the whole display can be seen at once, the centre of the house being filled

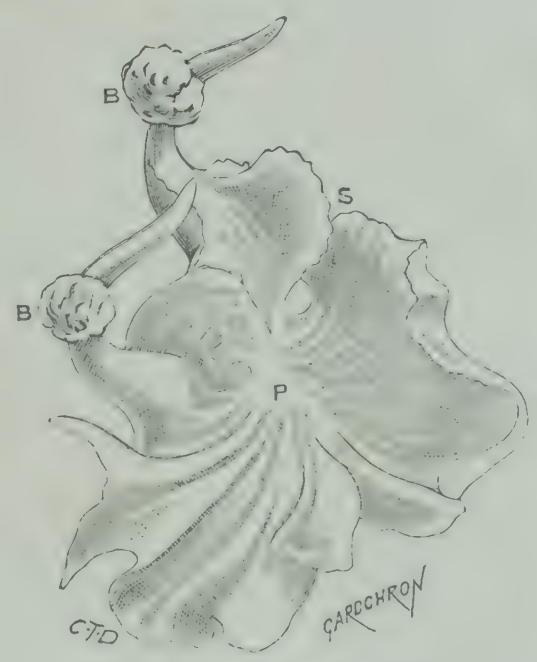

Fig. 75.—A curious fern prothallus.
P, Prothallus B B, Bulbils; S, Sinus. (Magn. 6 diameters)
(See p. 570.)

with dwarf-habited plants, over which are easily seen the sloping banks round the sides, and from which a path separates the centre group. A very good selection of the new varieties, together with all those of older birth worth keeping, are to be seen in the collection, and the number of visitors to the show is usually large, many of them coming a long distance.

In passing some good flowers of The Tribune, Mr. Pearson volunteered a word of praise for this clear and good lemon-yellow Japanese, and said that the blooms lasted with him as long as five weeks last season. He is right in thinking that such a quality is worth considering when certificates are granted to any new variety. Miss Maud Pearson, one of Spaulding's new seedlings from America, is a very pretty flower of pink and white, and in build resembles Viviand Morel, but is not so full. It is a pity that it gives signs of failing in a like manner to Golden Wedding. Commandant Blusset (Calvat) is here, and it may be described as one of the most distinct of new purple Japanese varieties with silver reverse. W. W. Coles is still a very popular flower with Mr. Pearson, and it is well done here. The new and handsome white Japanese Souvenir d'une Petite Amie was next noticed; and some first-rate blooms in size and colour of Chas. Shrimpton, but these are not quite developed. The new Excelsior, and Madame A. Chatin are looking well, the latter a very pure white, with large incurving florets. Some splendid blooms of Calvat's M. Chas. Molin are perfect in colour; the outer part of the flower is a red-orange and the centre bright yellow. Sarah Hill is an American incurved Japanese, of good quality; the bloom is yellow and the florets are wide and good. Another yellow variety, but rather thin, is Wilfrid Marshall, a new one sent out by Mr. H. J. Jones last spring; and Mrs. Dr. Ward is a hairy rose-coloured Japanese sent out by the same grower. Princess May, a white Japanese, from Mr. Godfrey, is opening well, and promises to be a nice full bloom. Duke of York, and the popular Louise are also in bloom. Dorothy Shea, G. C. Childs, and Vice-President Calvert, are fine, and of good colour; and Mrs. Alpheus Hardy will be represented by a bloom or two of fair quality. Charles Blick, a yellow Japanese of Mr. Owen's, is opening bloom, but it may not be very large. The incurved flowers were not developed at the time of our visit; but the Princess appeared to be coming fairly good, and the Queen section also. A very fine bloom of M. R. Bahuant was just past, and there were some good blooms of Madame Darrier. Pompons and singles are grown in less quantity than the Japanese, and the various forms between these and incurved and reflexed flowers which at present command by far the greatest share of popularity. One large orchard-house was filled with plants of Boule de Neige and Madame Page, the latter an ugly grower, but being valuable as well as the former for supplying a quantity of cut blooms at a late date.

The Fruit Grounds.—Although some of the land is occupied with ordinary stock of a nursery, and includes a quantity of evergreen subjects, the demand for fruit trees has necessitated further and further encroachments, and this specialty is being encouraged more and more by Mr. A. H. Pearson, the manager of this department. Many varieties in fruit trees are less fitted for the conditions in the Midland Counties than for those further south, and whilst the stock of trees includes all first-rate kinds, an effort is made to ascertain the best for the Midland district, and to keep of such a large stock. Newton Wonder Apple, which was sent out by the firm several years since, has proved to be one of the best varieties for the Midlands, and it is popular both north and south. It is a kitchen fruit, ripe about October, and is said to keep for twelve months; the tree is a good grower, and crops freely. We noticed a large stock of the variety in the grounds, and under different methods of training. All the fruit was gathered, but the trees throughout the nursery still retained their foliage, and the quality and style of training and cultivation could be readily noted. The ground where the fruit trees are planted is in the valley of the Trent, where a better loam is obtained than could be got near the nurseries already noticed. The subsoil is clay, and the situation is well exposed to the sun and the elements, which should tend to the production of trees that will not disappoint when removed to another site. We were impressed by the quality of the trained trees of all kinds, which show that great care is extended to them. During the first year a tree is trained on the spot where it grows, but instead of following the same system another year, they are all lifted and planted on a site selected for the purpose, and with two objects, viz., that the roots being moved this and every other year, until they are sold, may become more fibrous; and also as the trees are planted regularly in rows, the training can be done better than when they are running in miscellaneous directions in the midst of a lot of other shaped trees.

It seems worthy of remark that until ten days ago Mr. Pearson says that the ground was so dry that the lifting of trees was only effected with difficulty, and that until that time the rainfall for this last season was not so much as that of 1893. Without doubt, 1894 has been a poor fruit year, in the midlands especially, where the rainfall has been so low, for in addition to the cold weather,

and absence of sun, the fruit suffered from drought. Under these circumstances it is surprising to observe that the effect on the growth of the young trees has not been more marked, for taking the stock *en masse* it presents a very satisfactory appearance, in regard to the last completed growth, and in other respects it leaves nothing to be desired. Apples on the Paradise, as maidens, or of one, two, or more years old, abound in quantity, and in round numbers may be put at 70,000. It is satisfactory to learn that no stocks used in the nursery have originated from the seeds obtained from cyder presses, which must, if used, produce variable stocks in regard to habit and constitution. Domino is grown largely as a north-country Apple; it is in the way of a Keswick Codlin. Gascoigne's Seedling is another of the special kinds cultivated largely, but as the fruit of all varieties was gathered, our notes are concerned principally with the trees. A point of Mr. A. H. Pearson's deserving a word is the effort made to get satisfactory bases to these young trees before they get away too far, generally here they branch away and form a good base quite near to the ground. Pears are grown on the same lines as the Apples, and the same care is to be seen in the training. In regard to Plums, it is unusual to see them trained for a wall in the horizontal method, which Mr. Pearson maintains is a very satisfactory way of dealing with them. The Plum is a strong grower, and sometimes it is difficult to keep them below moderately-sized walls, and it is said that trained as the Pear, and fruited on spurs, the result is satisfactory. Rivers' Prolific, Victoria, and others are grown largely for walls, and many of them are on a low single-brick wall that encloses about 15 acres, representing the original fruit nursery. The wall is only about 4 feet high, and has been built with recesses here and there to give stability, but it is invaluable in a fruit tree nursery. Damsons are grown in fair quantity, and a stock here of the old Shropshire variety is still more popular with north country growers than the variety Farleigh. Gooseberries, finely trained in the gridiron fashion, and Currants also, figure in the nursery, beside Peaches, Nectarines, and other things. Our available time, however, was subject to the fact that we had to return to Beeston station, *en route* for the metropolis, and food for reflection during the journey was amply provided by what we had seen of "Pearsons of Chilwell."

Orchids at Messrs. F. Sander & Co.'s, St. Albans.

In the early days of this month we found a gorgeous display of flowers on clean, well-grown plants, in almost every house. The Cattleyas are especially fine, and by far the greater part of the display is made by the immense numbers of Cattleya labiata imported by the firm, and by their other great introduction, Dendrobium Phalænopsis Schroderianum, a typical Orchid for all sorts of cultivators—amateur or trade, large or small. The numerous and graceful sprays of flowers of the species form a telling feature, not only in the St. Albans nursery, but wherever it is grown in quantity.

For the Sanderian form of Cattleya labiata, it is not claimed that it is identical with the original autumn-flowering variety of C. labiata, although it bears an affinity to that plant in its time of flowering, but it is greatly superior to it in the size and colour of its flowers, and especially of the lip. Several of the long houses are furnished with the blooms of this fine Cattleya from end to end, and present a fine sight. Out of such a very large quantity, it seems pardonable to select a few of the best, and distinguish them by name, and of these we note C. labiata Sanderæ, of a glowing crimson over the whole flower; C. l. lilacina and C. l. illuminata, of very unusual and pretty tint; C. l. Madouxiana, C. l. splendens, and C. l. colossa, three immense-flowered varieties, and very richly coloured; and C. l. Hardyana, C. l. Albanensis, and C. l. Mundyana, all of which are very beautiful and distinct. Cattleya Bowringiana for showiness comes next, a number of plants being furnished with perfect bouquets of rose-purple flowers. Cattleya O'Brieniana, too, one of the prettiest of light-coloured Cattleyas introduced by Messrs. Sander of late years, is a welcome addition to the show, its flowers, which in size and form somewhat resemble those of C. Walkeriana nobilior, being very striking. It is unfortunately a very rare species, and unlikely to be so well represented in gardens as it deserves to be. Other species and varieties which make a display of flowers in the large intermediate houses are Lælia tenebrosa, some very dark forms; and L. purpurata alba.

Among hybrids the more remarkable were a new Cattleya obtained between C. Harrisoniæ and C. Hardyana, a fine acquisition, with large and delicately tinted rose-pink flowers, and evidently a free flowerer, for the plants bears six blooms; Lælio-Cattleya × Broomfieldiensis, the perfection of the hybridists' skill, and the handsome L.-C. × Vedasta, and L.-C. Gravesiæ.

In many places it is reported that the varieties of Lælia anceps are not blooming well this year, owing to the dull season, but at St. Albans there is little evidence of any falling off in this respect, the plants being liberally furnished with flower-spikes, the specimens of L. anceps Schroderæ, L. a. Sanderiana, L. a. Stella, L. a. Hollidayana, L. a. Hillii, and L. a. "Baroness Schroder," being among the best, and equally promising are L. Gouldiana, L. autumnalis atrorubens, and L. a. alba.

In the Cypripedium-houses is to be found almost endless variety in the ever-increasing number of hybrids. Among the most striking we noted C. × Morganiæ and its better variety "Burfordiense;" C. × Harrisianum superbum, C. × œnanthum superbum, C. × Adonis, C. × Ashburtoniæ expansum, C. × Pollettianum, C. × Lowengrenianum, C. × Haniachianum, C. × Lemoinierianum, C. × nitidissimum, C. × Leeanum giganteum, C. × Arthurianum, and some still handsomer new unnamed kinds; and among the species a great variety in C. Chamberlainianum, C. Spicerianum, the Sanderian strain of C. insigne, which yield the yellow forms; C. tonsum, C. Schlimii, and the very singular C. Sargentianum, illustrated in the *Gardeners' Chronicle*, June 23, p. 781.

A glance through other houses, in each of which there was a fine show of flowers, revealed a well-bloomed white Dendrobium album in more or less quantity; the pretty D. bursigerum of the D. secundum section, D. Phalænopsis and D. bigibbum, in quantity; D. sulcatum and the pretty and fragrant D. palpebræ; the very handsome D. cruentum, with its ivory flowers and blood-red lip; the stately D. veratrifolium, D. Augusta Victoriæ, D. superbiens, and many other species of Dendrobium.

In one house a fine lot of Calanthes in flower were noted; and amongst them several C. masuca, C. Victoria Regina, C. Cooksoni, and the sky-blue C. Laucheana. With these were numbers of Catasetums embracing many species, in bloom, being the large white C. pileatum; C. Christyanum, resembling some kind of insect; the helmeted C. semiapertum, and other species; several bright rose-pink Phalænopsis Sanderiana; the white P. amabilis, Angræcum superbum, A. Scottianum, and A. Sanderianum, one of the handsomest of white wreath-like Angræcum; Cœlogyne elata, C. barbata with seven spikes, and the new C. Sanderæ; Masdevallia Henriettæ, M. Gariana, and other Masdevallias and Restrepias, &c.

In a sheltered house kept moist and warm, the Zygopetalums of the Bollea and Pescatorea sections, and plants requiring similar treatment, such as Phaius tuberculosus are grown with success, and it is said that scarcely a day in the year finds the house without some plants in bloom. For a long time Pescatorea Klabochorum with its rich crimson tipped flowers have been in bloom and are still showy. So also that most beautiful of all the species with its white and violet flowers—P. Selmanni; and P. Dayana, P. Rœzlii, and others are about to flower. With them are a few pretty, pale yellow Chondrorhynchas, one with a deeply-fringed lip being specially attractive.

The New Plants.

Few nurseries can point to such a remarkable development during the last two years as that noted in the new plant department at St. Albans. New houses have been built for them and also for the crossing and raising of new Orchids; and new Nepenthes, Aroids, Palms, Ferns, and other foliage and flowering plants seem to have been produced by magic, and most of them of great merit. The completion of two more new houses caused the staff to be as busy as bees making haste to appropriate the fresh accommodation so much needed. One of the handsomest and most useful new plants at present in flower is Eucharis Stevensii, a very pretty thing, useful for all the purposes of cut flowers.

In the Orchid seeding houses we remarked well-advanced seed-capsules of many strange crosses, in which Lælia monophylla, Broughtonia sanguinea, Lælia Digbyana, Cattleya aurea, and other likely things have been used, and which will give some welcome novelties if their raising be successful. And if not, as Mr. J. Godseff, the clever manager at St. Albans says, "we must try again"—words which speak volumes for future successes.

Home Correspondence.

Specimen plants of Mignonette.—Amidst the wealth of flowering plants which we find in gardens to-day, it is no matter for surprise if some, however deliciously perfumed, should be now neglected as pet specimens, because their flowers are unattractive or inconspicuous. Mr. Hudson, of Gunnersbury House, almost alone grows as pot specimens the sweetly-perfumed Cape Pelargoniums, and fine plants he has too. No wonder, in spite of their lack of floriferousness, they are much admired. A few evenings since at Richmond, Mr. A. Chancellor, so long the energetic secretary of the Horticultural Society of that Surrey town, referring to his old love for Mignonette, at a meeting of the corporation allotment holders, offered to give prizes for the best specimen plants of it at the next allotments exhibition. It is late now to commence sending specimens of that description, as seed should be sown at the end of August thinly in small pots, and be raised in a frame, then finally thinned out to the strongest one only, and thus be grown on steadily all the winter. In that way the spring sees the foundation of a fine plant laid, and with some pinching the proper pyramidal form is soon fashioned. I believe it is in this way Mr. Molyneux starts the formation of his fine standard plants. A good stock of the Giant White, because it is not only a strong grower, but is a very free-branching and blooming strain, is perhaps the best. If seed be sown early in the spring in warmth under glass in the way advised, it will still be possible to secure neat, strong specimens, but not such plants as autumn-sown seed gives. There is no art in having Mignonette plants thickly stood in pots. Those anyone can produce, but really fine pyramidal specimens are handsome and interesting. To get them, however, will severely tax the cultural skill of allotment holders. *A. D.*

The Black Currant Mite.—I was much amused on reading "A. D.'s" remarks on p. 540 of last week's issue of the *Gardeners' Chronicle* on the above subject. What a world we live in! To find that a person of his calibre should never have seen the "Currant-bud mite." One would have thought that with so wide a range of entomological science as your correspondent possesses, that he would have been conversant with most of the insect pests that gardeners have to contend with. It is not to poor or badly-cultivated gardens that its ravages are confined, or to old or neglected bushes, for I have seen hundreds of bushes in some places where Black Currants are grown largely attacked with them. It wants no glasses to enable a person to distinguish its presence, not even a pair of spectacles, unless the person wearing them be very near-sighted, for the fruit-buds are usually more than double their ordinary size; they are also of a different colour, as they lose that freshness in appearance when badly attacked. Mr. Farr made a careful examination of some shoots that were taken him, and found some scores in a single bud. Your correspondent must be in error when he says they are unknown to myriads of gardeners, for I hope that the fraternity in general consists of men who are

not devoid of one of the first attributes of a good gardener, viz., powers of observation. I trust that most of us know what a mite is, though we may not be able to discern the difference between a maggot and a caterpillar. We who wish for information on all subjects bearing on our calling are thankful to those who are able, even in the smallest degree, to help us, and are not such pyrrhonists as your correspondent appears to be. It is well for those who have never been troubled with the Currant-mite, though those who never have should make themselves acquainted with its habits. *H. C. Prinsep.*

—— Your very sensible foot-note to your correspondent, "A. D.," in last week's *Gardeners' Chronicle*, will be appreciated by those who have had experience of the Currant mite. I must say, in the case of "A. D.," ignorance is bliss. I have experienced its ravages, and the difficulty of effecting a cure. I have attended carefully to picking, and have repeatedly applied the Board of Agriculture's directions in spraying with their recommended mixture. I cut down a good few bushes two years ago, burnt all that I could; carefully looked over the growths in spring, and sprayed the ground; and even under good cultivation I cannot say I have in any way succeeded in getting rid of this scourge, and I think there is no way of doing so but by a thorough clearance. My plants are not the only ones in this county which are infested, as it is in many other localities, and I believe it is spreading fast. Should "A. D." experience a visitation of the mite, he will find it anything but a bogey to annihilate. *B., Perthshire.*

UNSEASONABLE FLOWERING OF HOTEIA JAPONICA.—Is it not very unusual to have plants of Hoteia (Spiræa) japonica in full bloom and foliage, one or two with nearly thirty spikes on each at this season? All of these plants bloomed splendidly in the spring, and have since been standing outdoors in the same pots they were then growing in. They have been housed about three weeks, and the foliage is beautifully green and fresh. Would it not be a great acquisition if we could always command them at this time of the year. I have never observed this plant to bloom in like manner. *F. G. Brown, Myton House, Warwick.*

NOTES ON PEARS.—I must apologise for trespassing with additional remarks to those already advanced upon this subject. My excuse is, that we seldom get in our low situation so good a crop as we did this year to take notes from. To prevent confusion, I will confine myself to trees upon walls, which this year escaped injury from frost at the critical season, the result being that we had a plentiful crop, so abundant that it was expedient to thin some varieties, although this was not done with the free hand the case required. It may be observed that there is an appreciable difference not only in the size, but also in the flavour of fruits of the same variety from trees that are heavily or lightly cropped, the other conditions being identical. On the whole, however, our Pears are deficient in their usual degree of flavour. The low summer temperature is evidently responsible for the deterioration, and possibly it has had more effect upon heavy soils like ours than upon that which is comparatively light. With regard to size, taking the varieties collectively, they are not up to the average, although some are very large, and most of them are clean, and handsome. Amongst early sorts, Jargonelle, Williams' Bon Chrétien, Clapp's Favourite, and Beurré d'Amanlis were not highly-flavoured; the last two, however, were large, and clean. Louise Bonne of Jersey was remarkable for its heavy crop, but it was deficient in size and flavour, as were also Beurré Hardy and Beurré Superfin. The following kinds, Doyenné de Merode, Pitmaston Duchesse, Flemish Beauty, Beurré de Capiaumont, and Marie Louise d'Uccle were alike free bearers, their fruit being both large and handsome; nevertheless, from want of good flavour, they are only fit for stewing. Flemish beauty is generally improved by being gathered early, and I note that Mr. Bunyard recommends this practice for Pitmaston Duchess; but this was of no avail here in the case of Flemish Beauty this season. Triomphe de Vienne, Beurré Bosc, Vicar of Winkfield, General Todtleben, and Hacon's Incomparable, may be this year classed together as light bearers; this, however, assisted them to swell their fruits to a very large size. The two last-named are invariably shy croppers here, but it may be mentioned that Hacon's is on the Pear stock, and I have seen it noted that it crops freely when worked upon the Quince. Lately I saw a good crop of moderately-sized clean fruit upon a large standard tree of Beurré Bosc in a Monmouth villa garden, and was told by its owner that it is usually highly-flavoured. A wall is generally considered essential in order to get this variety satisfactory. We get fine fruits of it from cordons on an east wall. There was also in the same place a standard Easter Beurré carrying a good crop of fair-sized fruits, which were unfortunately disfigured by Cladosporium. Here this variety is worthless unless favourably situated upon walls, and even these young trees produce better fruits than those do that are old. I will now group some mid-season Pears which possess the richest flavour with us this year; they are Marie Louise, Doyenné du Comice, Beurré d'Anjou, Durondeau, and Comte de Lamy. Of later sorts, which it is too early to speak of respecting flavour, but which have yielded crops more or less deserving of note, I may include Marie Benoist, very fine; Winter Nelis, Olivier de Serres, Beurré Diel, Bergamotte d'Esperen, Ne Plus Meuris, Easter Beurré, Beurré Rance, and Glou Morceau. The three last-named are more or less affected by fungus, Beurré Rance being badly spotted and cracked. *Thomas Coomber, Hendre Gardens.*

"DISQUALIFIED."—This is [not] a gratifying word to meet the eye of an exhibitor when entering a show after the judges have made their awards. Such was my case at Kent County Chrysanthemum Show on Wednesday, October 31, and again at Battersea on Friday, November 2. In the first case, the judges had awarded 2nd prize in the large open class, which contained also the two premier blooms (Japanese and incurved) in the show. I was disqualified for using 7-inch boards. Now, I will not make any comment upon this, but will ask anyone who saw them if those blooms could have been seen to advantage on a 6-inch board, for most of them were 8 inch blooms? The judges would not disqualify them, but the committee did. Regulation 8 says:—"Exhibitors are requested to have their stands made in accordance with the metropolitan plan," &c. What does this mean? If anyone can unriddle this for me I shall be much obliged. Then, again, at Battersea, this discomforting word was very prominent. In this case, it was the judges who disqualified them. This Society is affiliated with the National Chrysanthemum Society; and as the regulations say the boards must be 24 inches long and 18 inches wide, I wrote to the Secretary, and his reply was as under:—"You may exhibit under exactly the same conditions as prevail in the National Chrysanthemum Society." This I did. My blooms were far superior to any others in the class, and could not have been crowded on to a small board. I should really be very glad to know from good authority what I had better do under the circumstances. *W. Wells, Earlswood Nurseries, Redhill.*

FICTION, FRUIT, AND FACT.—I immensely enjoyed the manner in which Mr. Blackmore turned upon his pursuers and rent them, in last week's *Gardeners' Chronicle*, but nevertheless, I must take up the cudgels a little on behalf of our trade which otherwise—that is, unless the matter is taken up by abler hands—would rest under the serious imputation of "booming" a trade, which is known to be a losing one, for personal gain. Mr. Blackmore compares the sellers of fruit-trees to racing tipsters, &c., and challenges us fairly to try our own prescriptions; now I can at least quote one instance to show that we are a little more sincere than the class to which we are likened, for the last time I was at Sawbridgeworth I found that Mr. Rivers was planting up all his spare ground with permanent trees for fruiting, and at the time of my visit a small army of men and women was sorting and packing Plums for market. Some innocents may think this was simply the outcome of experiment, or that a large sum of money is being wasted in decoy ducks, but I do not think those who know the astute proprietor personally will credit him with embarking rashly in a losing game. As regards the past, I could show from our own books that fruit-growing even in the midlands, where we are certainly not favoured as regards climate, has paid, and more than that has paid remarkably well, though that was before foreign competition was so serious a consideration as at present. I know men whose financial position might be envied by many of us, who have made all they have out of fruit-growing, though too shrewd to draw attention and consequent competition upon themselves. Being now out of fruit-growing, I cannot speak so confidently as to present profits, but I do know that all through the fruit-growing districts there is a keen demand for farms with a fair proportion of orchards on them, while purely agricultural land can scarcely be let at any price; also that the men engaged in fruit-growing generally have a comfortable appearance about them (however they may groan about market returns), which does not look as if the game were played out. The fact is, I believe that fruit-growing so far from being a decayed industry is still in its infancy, that we shall even yet drive the foreigner out of our markets; and still further, that it will pay us to do it. *Chas. E. Pearson, Chilwell Nurseries, Notts.*

—— I am delighted with Mr. Blackmore's letter in last week's *Gardeners' Chronicle*, p. 541, his case in reference to sales of Pears, &c., is exactly what I have recently experienced. I grow Marie Louise on walls, Beurré Bosc, Beurré Hardy, and a host of others from walls of which we can boast of a length of nearly half a mile, as well as a splendid lot of pyramids on a soil well suited to Pears and Apples, so much so that a speck or crack is not to be seen. Yet for all their good qualities I have sold many bushels at 1*s.* per bushel, and then when delivered, was told "do not send any more as the market is glutted." So many bushels—yes, quite twenty of a morning—were scraped together from under the trees and laid in heaps to rot, it did not pay to gather them. Before we engage, or incite others to engage, in fruit-growing for profit, we ought to put our own experience and facts in the scale so that the enterprising public may see where their money is going. I would not in the least discourage fruit-growing, but fruit-farming is another matter altogether. When we can utilise our fruit as the Americans do, then I say, go ahead. This applies to vegetables as well, Scarlet Runners 1*s.* per bushel, now 4*d.* per pound, such is my experience from September to this date. What we want is the "coming man," of enterprise to utilise as well as grow, so that when a good crop favours us we shall be able to deal with it. I knew by Mr. Blackmore's letter he has great experience and discernment, and strange as it may seem, before the *Gardeners' Chronicle* came into my hands, I was then reading his *Perly Cross*, where he speaks of the Camellias, and I could but reflect, how observant Mr. Blackmore has been, and this point is the keynote, viz., observation, without which, success is never gained. Were all amateurs as keen as he, much disappointment would be spared. Yet, for all this, to plod on, with a great determination to master a few important points such as suitable soil, locality, and the proper selection of varieties, will end in a reasonable success, and give great delight to anyone who loves his garden, such a one I am sure is Mr. Blackmore. *Charles Ilott.*

—— In reply to the letters of Mr. Blackmore on fruit-growing, which he calls a "fatal fad," which appeared in your columns a short time ago, and now again in your current issue of November 3, I will ask you to publish this, which shows the matter in another light. Mr. Blackmore shows himself as a fruit-grower; so do I. Has he ever done it for a living? If not, his testimony is useless. I am engaged in growing fruit for a livelihood, my operations being all in the open ground, as Mr. Blackmore so much desires to see as stated; but as he treats of work under glass as well, I made it my business to visit a branch establishment of the Channel Islands Fruit Company, and there met Mr. Peak, the managing-director, in company with another principal shareholder. They very courteously showed me round the glasshouses and premises, and answered all my questions. One of the chief (and a very plain one it was) was this—"Are you satisfied with your undertaking?" The immediate answer was—"Yes." And as a proof of which, they quickly showed me a new erection of glass, 280 feet long, and spoke very highly of the crop taken out of it this year. Another point they pressed upon me was, that they had this year grown three crops of Melons in one house. They said, although the prices of the immediate present did not return much profit, yet they should be satisfied if all the remainder of the crop of Grapes was sold for 1*s.* per pound. The first prices of the year were 15*s.* per pound, gradually sinking as supplies came in. When anyone can see establishments such as these, and others like them, continually growing through all such depressions as Mr. Blackmore speaks of, it shows the "fad" is not fatal to prosperity. This is for the indoor operations; and as to the outdoors, "my books" are also open, and at the service of anyone menaced with symptoms of the "fatal" fear. They are carefully made up to the end of 1893, and show a compound-interest for money invested from the commencement of the business in 1885. This is sufficient to tempt me to plant as much new orchard again this year as I can. I have an account of a Gooseberry patch I visited this year; the value of

the produce was £126 per acre, and it is of considerable size. It is young, and bids fair to yield this for a good many years to come. I have one Pear-tree that yielded me 25 bushels of Pears last year, the fruit of which I made into perry, and it is valued at £10 wholesale. This tree yielded me this year about 15 bushels, and the liquor will be worth £6. It may also be seen that such firms as that at Totnes, with several others, do very well with vintage operations. There are many thousands of acres in the country now barren, which under fruit would yield handsome returns, even if only for vintage purposes. Sixpence per bushel for Apples or Pears is a paying price, and would find a living for a rural population, and vastly increase the value of landlords' property. *B. Wells, F.R.H.S., The Fruit Nurseries, Crawley.*

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

CHRYSANTHEMUMS at the annual show of the National Society, held on November 6, 7, and 8, in the Royal Aquarium, Westminster, were a surprise to many who had anticipated that the quality of blooms generally would be weak. It is no exaggeration to say that the exhibition, on the whole, was well up to the average in regard to quality; there were some weak stands, but these were far outbalanced by first-rate exhibits. Japanese blooms that secured a 1st prize in any class were of no mean quality, whilst those successful in the more contested and open classes were as good as could be wished. Incurved blooms, as we expected, were much superior to those exhibited last year, and were good, though hardly equal to exhibits of this section that were familiar several seasons ago, when they were more popular. Had the show been a week later, incurved blooms would have been better. Pompons, Anemone-flowered and singles, were shown in about the usual manner, and the trained plants do not call for any special remark. A wonderful show was made by competitors in the classes for artistic arrangements calculated to illustrate the value of Chrysanthemums for decoration, and the bulk of these were tastefully and effectively executed. The arrangement of the classes was again anything but satisfactory, and the poor light that reached some of the exhibits was very prejudicial to the colour of the flowers. Had the weather on the opening day been less bright, things would have been worse in this particular.

CUT BLOOMS.

A Societies' Competition.

The First Class is one in which Chrysanthemum and Horticultural Societies are invited to exhibit, and the blooms staged may be furnished by as many of the members of such societies as is convenient to the society. A collection has to contain forty-eight blooms, including twenty-four incurved distinct, and twenty-four Japanese distinct. The Challenge Trophy and 1st prize was won on this occasion by the Bromley Chrysanthemum Society, Kent, and the blooms were from about half a dozen members of that society. The general quality of the exhibit was good, and among the Japanese were fine examples of Mdlle. Thérèse Rey, G. C. Schwabe, Viviand Morel, Boule d'Or, M. Panckoucke, Col. W. B. Smith, Sunflower, Kentish Yellow, Marie Hoste, Gloire du Rocher, and Miss Muriel Scott, the last-named was a specially pretty bloom. Several of the incurved flowers were not quite finished, particularly a bloom of Jardin des Plantes, but there were fairly good flowers of Baron Hirsch, Princess of Wales, Mrs. Heale, Guernsey Nugget, and Miss Violet Tomlin. The 2nd prize was taken by the Havant Society, who staged, amongst others, noteworthy blooms of Col. W. B. Smith, International, Sir E. Smith, Princess May, G. C. Schwabe. Incurved were rather small, but some of them were pretty, such as White Empress, Alf. Salter, Lord Alcester, Golden Empress, &c. The St. Neot's Amateur and Cottage Horticultural Society, Huntingdonshire, as 3rd, and the blooms in this collection were all from Mr. J. Myers, Hinchingbrook Gardens, Huntingdon.

Open Classes.

Incurved Blooms.—As we have already stated, the quality of incurved blooms was better than we saw them last year, and the collection of thirty-six distinct blooms, staged by Mr. W. Mease, gr. to A. Tate, Esq., Downside, Leatherhead, for the Holmes Memorial Cup and £10, as very satisfactory. We will append the whole of the varieties shown, as they will be a guide to the thirty-six best in this section:—Golden Empress, Robert Petfield, Mrs. Robinson King, Miss V. Tomlin, Miss M. A. Haggas, Mrs. Mitchel, Princess of Wales, Robert Cannell, Lady Hardinge, Mons. R. Bahuant, Jeanne d'Arc (good) Lord Wolseley, Lord Alcester, Madame Darrier, Mrs. N. Davis, Jno. Lambert (good), Mrs. S. Coleman, Princess Teck (good, but too loose), Noel Pragnell or the Striped Empress (very good), Camille Flammarion, Brookleigh Gem, C. B. Whitnal, Empress Eugénie, Baron Hirsch, Jno. Doughty, Ami Hoste, Mrs. Wm. Shipton, A. Salter (good), Mrs. Heale, Prince Alfred, Empress of India (very good), Jno. Salter, J. Kearn, Queen of England (good), Lucy Kendal, and Lady Dorothy. The 2nd prize collection came from Mr. W. H. Lees, gr. to F. A. Bevan, Esq., Trent Park, New Barnet, and it included good blooms of Queen of England, Golden Empress, Princess Teck, Jno. Lambert, Miss V. Tomlin, Mrs. Dixon, Mrs. Heale, and Madame Darrier. Mr. J. Myers, gr. to the Earl of Sandwich, Hinchingbrook, Huntingdon, was 3rd.

In the class for twenty-four blooms distinct, the best collection was staged by Mr. G. King, gr. to M. Jenks, Esq., Canons Park, Edgware, Middlesex. The quality was a little below that in the larger class, and the blooms were a little flat. The best were Jeanne d'Arc, Barbara, and Miss V. Tomlin; 2nd, Mr. Thos. Robinson, gr. to W. Lawrence, Esq., Elsfield House, Hollingbourne, near Maidstone; and Messrs. Hobday & Son, Cambridge, were 3rd.

The best twelve blooms among seventeen or eighteen competitors were from Mr. W. Higgs, gr. to J. B. Hankey, Esq., Fetcham Park, Leatherhead, and a very good lot was staged. The following were especially so: Jno. Doughty, Prince Alfred, Miss M. A. Haggas, Baron Hirsch, Golden Empress, and Alfred Salter. Mr. B. Calvert, gr. to Col. Archer Houblon, Hollingbury Place, Bishop's Stortford, was a close 2nd; and Mr. H. A. Page, gr. to F. Crisp, Esq., White House, New Southgate, N., was 3rd. The 4th prize went to Mr. A. Jones, gr. to Miss Weyburn, Hadley Manor, Barnet, and an extra one was awarded to a stand from Mr. A. Sturt, gr. to N. L. Cohen, Esq., Englefield Green, Surrey. Mr. W. Collins, gr. to J. W. Carlile, Esq., Ponsbourne Park, Hertford, had the best in the class for six blooms of one variety, and showed Queen of England. Several of the blooms were good, but others rather flat. 2nd, Mr. B. Calvert with Miss M. A. Haggas, and 3rd, Mr. A. Jones with Golden Empress. The best six incurved blooms distinct of varieties put into commerce in this country during 1892 or 1893, were staged by Mr. Robert Petfield, gr. to A. J. Thornhill, Esq., Huntingdon, and the varieties were Madame Darrier, Baron Hirsch, Brookleigh Gem, Sir Titus, Mr. G. Eyerman, and Robert Petfield. The three first-named are the best and are now pretty well-known. Robert Petfield is also fair. 2nd, Mr. J. Agate, Havant, with Robert Petfield, Lucy Kendal, Mr. F. Murray (rather poor as shown), Mr. J. Kearn, a white (rather flat bloom as shown), and Sir Titus.

Japanese blooms.—The competition in these classes was invariably good, and the quality of the blooms in most cases excellent. It was a magnificent collection of forty-eight varieties, that was staged by Mr. W. H. Lees in the competition for the Holmes Memorial Cup and £10, and well staged also.

The varieties were Mrs. C. H. Payne, Florence Davis, W. Tricker, W. H. Lincoln (very good), M. Ad. Sirocid, Madame Calvat, Mrs. E. W. Clarke, Mdlle. Marie Hoste, Jno. Shrimpton, Madame Ad. Chatin (good, but not quite finished), Mrs. E. Wheeler, M. Panckoucke, Commandant Blusset, Mdlle. Thérèse Rey, Madame Octavie Mirabeau, Sunflower, M. Bernard, Henri Jacotot Fils, Duke of York, Stanstead White, Amos Perry, Primrose League, Mrs. Dr. Ward, Pearl Beauty, Chas. Davis, Madame J. Bayley, Beauté Toulousiene, Viscountess Hambledon (capital), Beauty of Castlewood, Niveum (fine), Edwin Molyneux (grand colour), Cecil Wray, Mrs. E. S. Whittle, Mrs. W. H. Lees, Col. W. B. Smith, Souvenir d'une Petite Amie, Etoile de Lyon, M. E. A. Carrière, G. C. Childs, Madame Carnot, Mrs. F. Jameson, Puritan, Miss Dorothy Shea (capital), Madame Chas. Capitant, Mrs. E. S. Trafford, Viviand Morel (extra deep), H. L. Sunderbruch, a capital broad-petalled yellow, and Avalanche. The collection which followed was put up by Mr. Mease, and though the blooms were smaller, the collection was a first-rate 2nd; his best flowers were Niveum, Viviand Morel, Excelsior, Eda Prass, Sunflower, Miss Dorothy Shea, Mdlle. T. Rey, and International; W. H. Fowler, Esq., Claremont, Taunton, was 3rd, with a satisfactory lot; and Mr. W. Wells, Earlswood Nursery, Redhill, Surrey, 4th.

For a collection of twenty-four blooms, distinct, a Silver Cup was offered by Major A. Collis-Browne, in addition to the first money-prize. The quality of the exhibits was excellent, and the 1st prize was awarded to a collection from Mr. W. H. Lees, his best blooms being Viviand Morel, Madame Carnot, Souvenir d'une Petite Amie, Primrose League, W. H. Lincoln, Mdlle. T. Rey, Chas. Davis, and Sunflower. A very good lot from Mr. Wm. Allan, gr. to Lord Suffield, Gunton Park, near Norwich, was 2nd, and included were fine specimens of Viviand Morel, C. Shrimpton, Duke of York, Mdlle. Thérèse Rey, Val d'Andorre, and Sunflower. Mr. W. Higgs was 3rd; and Mr. W. Collins was 4th.

A Silver Cup, presented by Mr. H. Jones, Ryecroft Nursery, Lewisham, formed an additional reward to the winner of the 1st prize for twelve blooms, distinct, which fell to Mr. W. Messenger, gr. to C. H. Berners, Esq., Woolverstone Park, Ipswich, who staged a very grand lot; this included a most superb bloom of Viviand Morel, also good Mdlle. T. Rey, Florence Davis, Sunflower, W. H. Lincoln, Etoile de Lyon, and Chas. Shrimpton. Mr. A. Sturt was a good 2nd, especially in his M. Benard, Amos Perry, and Chas. Davis. Mr. B. Calvert was 3rd; and Mr. A. J. Driver was 4th.

The best six blooms of any white Japanese variety were of Avalanche, shown by Mr. Sandford, gr. to W. Wright Ingle, Esq., Woodhouse, North Finchley. Mr. R. Jones, gr. to C. A. Smith Hyland, Esq., Barford Hill, Warwick, was 3rd with Mdlle. T. Rey; and Mr. Collins' stand of the same variety was Commended.

Mr. Sandford was also successful in the class for any other variety excepting white, with large, finely-coloured Chas. Davis; Mr. W. Mease was 2nd, with Sunflower; and Mr. Chas. Cox, gr. to Jno. Trotter, Esq., Brickendon Grange, Hertford, 3rd, with Edwin Molyneux. There were seventeen exhibitors.

Six Japanese incurved were best from Mr. A. J. Driver, gr. to Mrs. Davies, Bridgend House, Stonehaven, who had Stanstead White, Waban, Robt. Owen, E. Molyneux, Thunberg, and Lord Brooke; 2nd, Mr. B. Calvert, who had good Louis Bœhmer, Enfant des deux Mondes, and William Tricker; Mr. Thos. H. Lodge, gr. to the Rev. J. Menet, Hockerill, Bishop's Stortford, was 3rd.

Hairy-petalled Varieties.—The 1st prize for six Japanese blooms, hairy-petalled varieties, distinct, was taken by Mr. Philip Plumb, gr. to G. J. Beer, Esq., Langley Park, Watford, Herts; he had Hairy Wonder (figured in the *Gardeners' Chronicle* last week), Mrs. Trelease (a rose-coloured variety), Louis Bœhmer, Mrs. A. Hardy, W. A. Manda (yellow), and Enfant des deux Mondes.

Anemone, Japanese.—Mr. Skeggs was the winner of the 1st prize for twelve blooms, distinct, and showed very good blooms of varieties similar to those included in the class for large-flowered and Japanese Anemones; 2nd, Mr. R. C. Notcut, Broughton Road Nurseries, Ipswich, an excellent 2nd; and Mr. Jno. Milner was 3rd.

Reflexed Blooms, large flowered.—Mr. Collins, with a good average collection, was 1st for twelve large-flowered reflexed blooms, the best of which were Golden Christine, Cullingfordi, Cloth of Gold, White Christine, and Pink Christine; Mr. Chas. Cox was a very near 2nd indeed; and Mr. A. Felgate, gr. to Her Grace the Dowager Duchess of Wellington, Burhill, Walton-on-Thames, was 3rd.

Anemone Blooms, large-flowered.—Mr. Skeggs, gr. to A. Moseley, Esq., West Lodge, Barnet, Herts, was 1st for twenty-four distinct large-flowered Anemone blooms, Japanese included. It was a very fine collection, and as these varieties deserve more extended favour, we append the names of all those in the 1st stand, Queen Elizabeth, Duchess of Westminster, Glück, Nelson, Mrs. J. Benedict, Cincinnati, Mrs. Linan, Miss Margaret, Marie Laglaize, Jeanne Marty, Delaware, Jno. Bunyan, M. Dupanloup, W. W. Astor, Empress, Madame Nathaniel Brun, M. Charles Leboscqz, Souvenir de Dorothée Souille, M. Panckoucke, Madame Lawson, Gladys Spaulding, Mdlle. Gabriel, Sabine, and Grand Alveole. The 2nd prize was taken by Mr. Jno. Miller, gr. to Mr. W. A. Higgs, Willenhall Park, Barnet, who had also a nice lot. 3rd, Mr. A. Iver, gr. to E. E. Jakes, Esq., Hadley Lodge, Barnet. The

last-named exhibitor was 1st for twelve blooms of large Anemone-flowered with Japanese excluded, and the stand included good blooms, Delaware, Lumière d'Argent, Cincinnati, Grand Alveole, and Thorpe Junior; Mr. W. Skeggs, gr. to A. Moseley, Esq., West Lodge, Barnet, was 2nd; and Mr. Chas. Brown, 3rd.

Anemone Pompons.—The best twelve blooms of these were from Mr. J. Myers, gr. to the Earl of Sandwich, and amongst a very pretty collection the following were the most attractive, Francis Boyce, Magenta King, Madame Chalounge Pearle, Marguerite de Coi, and Madame Montels; Mr. W. Aldridge, gr. to G. Lacy, Esq., Springfield Gardens, Palmer's Green, N., 2nd; and Mr. Charles Brown, gr. to R. Henty, Esq., Langley House, Abbots Bromley, Herts, 3rd.

Pompons.—In the competition for the best twelve distinct varieties, three blooms of each, excluding Anemone Pompons, Mr. T. Caryer, gr. to A. G. Meissener, Esq., Weybridge, was most successful. The prettiest of a nice collection were Rubra perfecta, W. Westlake, President, Charles Dickens, and Scapin; 2nd, Mr. T. L. Turk, gr. to W. F. Boney, Esq., Cholmeley Lodge, Highgate, with another good lot; 3rd, Mr. C. Brown. In the following class for a like number of flowers, but as grown without disbudding, the 1st place was taken by Mr. Brown; 2nd, Mr. T. L. Turk.

Single-flowered varieties.—Mr. J. Agate, Havant, had a very fine stand in the class for twelve single varieties in sprays of three blooms each. The best were Golden Star, Purity, Snow Wreath, Jane, Miss M. Wilde, and Mrs. D. N. Crane; Mr. W. Wells, Earlswood Nurseries, Redhill, Surrey, was 2nd, and included Earlswood Terra-cotta, Emily Wells, and Nora, three very pretty varieties; 3rd, Mr. G. Carpenter, gr. to Major Collis-Browne, Broad Oaks, Byfleet.

Amateurs' Classes.

The first class, devoted to amateurs only, was one for twenty-four blooms of Japanese, in not fewer than eighteen varieties, for which the 1st prize was 30*s.*, and in addition, a nickel-silver tea-service, presented by Mr. J. A. Restall, jeweller, 2, St. Martin's Place, Broad Street, Birmingham.

Mr. Jno. Horril, The Workhouse, Havant, was 1st with a collection, reflecting highest credit on the amateur who exhibited them. The best blooms were Miss Dorothy Shea, Condor, Viviand Morel, Stanstead White, Mdlle. T. Rey, Golden Wreath, and J. S. Dibbin. There was a very spirited competition, and the 2nd place was secured by Mr. H. Love, Melville Terrace, Sandown, Isle of Wight, with smaller but good blooms; 3rd, Mr. Alfred Holmes, Fort Grange, Gosport.

The best twelve incurved blooms were also staged by Mr. A. Holmes, and the varieties included good Princess Teck, Mrs. Heale, Refulgens, Lucy Kendal, and Miss M. A. Haggas.

Mr. Fred Durrant, 4, New Road, Ware, was the exhibitor of the best six incurved blooms, of which Jeanne d'Arc and Prince Alfred were very good; Mr. Holmes was 2nd; and C. E. Wilkins, Esq., Wellington, Swanley, Kent, 3rd.

The best twelve Japanese blooms were staged by Mr. H. Love, who had a stand of medium-sized neat blooms of good quality, and who was followed by Mr. Arthur Stammers Knowles, Maldon, Essex, and Mr. Jas. Stredwick, Silverhill Street, St. Leonard's-on-Sea.

G. E. Piddington. Esq., Leigh, Essex, staged the best six Japanese, having Charles Davis, Colonel W. B. Smith, Mrs. Harman Payne, Viviand Morel, Mr. A. G. Hubbuck, and Beauty of Exmouth, all good; 2nd, Mr. H Lee, 3, Toronto Place, Moreland Road, Gosport; 3rd, Mr. Geo. Peck, St. James Street, King's Lynn.

The best six Japanese blooms of any one variety were from Mr. H. Love, who had good blooms of Sunflower; 2nd, Mr. Jas. Stredwick, with Avalanche; and 3rd, Mr. W. Batten, Old Basing, Basingstoke, Hants, with the same variety.

Amateur and Single-handed Gardener's Classes.

Mr. T. L. Turk was the exhibitor of the best collection of twelve incurved blooms, distinct, with a very creditable lot of flower. He was followed by Mr. E. Tickner, and Mr. S. J. Cook, gr. to J. H. Hartridge, Esq., Holmwood, Hendon, N.W.; and the best six incurved were shown by the winner in the last class also, being followed by Mr. W. C. Pagram, gr. to A. F. Hobhouse, Esq., Weybridge; and Mr. W. Jones, gr. to W. Hooper, Esq., Glena Mount, Sutton, Surrey.

Capital blooms were shown by Edwin Smith, Esq., Ingleside, Chatham, in the class for twelve Japanese, distinct; especially good were Lord Brooke, Mrs. E. W. Clarke, Viviand Morel, W. H. Lincoln, and Chas. Davis. Mr. E. T. Tickner, gr. to J. Watney, Esq., was 2nd; and C. W. Richardson, Esq, Fairgrieve House, Sawbridgeworth, 3rd.

Metropolitan Classes.

These are limited to growers within the area of the county of London. The first class here was for twelve incurved blooms, the best coming from Mr. Brigham, Stoke Newington, who was also 1st in the class for six blooms.

For Twelve Japanese, Mr. W. Davis, gr. to W. F. Darnell, Esq., Stamford Hill, was 1st with medium-sized but good blooms; Mr. Brigham was 2nd. With six Japanese, Mr. Beech, gr. to L. Seligman, Esq, South Kensington, was best; 2nd, Mr. Davis.

Amateurs' Special Prizes.

In the class for twelve incurved flowers, the 1st prize being a small boiler, given by Messrs. J. Deard & Son, Harlow, in addition to the money prizes offered by Mr. H. J. Jones, the only competitor was Mr. J. Horrel, Havant, who had the prize. The 1st position was taken by Mr. Yeoman of Hounslow, for twelve Japanese; Mr. Amies, of Ashford, Kent, coming 2nd. For six Japanese, Mr. A. A. Botwright, of Kensington, was 1st, and Mr. R. E. Wilson, from the same locality, 2nd.

Plants.

Trained Chrysanthemums were shown in very fine form, and were much admired by those who like these huge formal specimens. With six remarkable plants, large flowered, averaging 6 feet across, a veteran grower, Mr. D. Donald, gr. to J. G. Barclay, Esq., Leyton, was an easy 1st; he had densely-flowered Chinaman, W. Tricker, Florence Piercey, Margot, and White and Pink Christine. Mr. Easey, gr. to C. Mills, Esq., Highbury New Park, was 2nd.

With four trained plants, Mr. Davey, gr. to C. C. Paine, Esq., Stamford Hill, was 1st, having good plants of Margot, Col. W. B. Smith, Dr. Sharpe, and Elaine.

Mr. Davey also had the best six standards of similar varieties, very good specimens; Mr. Easey coming 2nd. With four trained standards, Mr. Donald was an easy 1st, having grand plants of Bertha Rendatler, Stanstead Surprise, Chinaman, and Margot. The same grower was the only exhibitor of six trained Pompons, wonderful plants of Dupont de Léon, William Kennedy, Antonius, Sœur Melanie, and Blanch Douglas.

Mr. W. Wells, Earlswood, was the only exhibitor of six singles untrained, and well-flowered were Rose Pink, Foxhunter, Bertha Jenks, &c.

Table Decorations, Vases, &c.

The whole of these very beautiful, as well as remarkable, arrangements were found up in the gallery, where it is feared few of the general public saw them, yet it is doubtful whether any features of this fine show possessed greater beauty or were so attractive.

The finest product, without doubt, was found in the competition for the President's piece of plate and other prizes, and was in the form of tables 18 feet by 6 feet, standing against a wall, so that one face only was needed to be filled in the most artistic way by the competitors, of whom there were three. The 1st place was taken by Mr. H. J. Jones, of Lewisham, with what must be truthfully described as the most beautiful, as well as the finest of any similar arrangement ever seen.

At the back hung soft green drapery, then came some very lofty vases, holding clusters of flowers. Dwarfer ones fronted these similarly dressed, and in front were many flowers set singly in a bed of Ferns and foliage. The whole was dressed with Ferns, Crotons, and Asparagus, whilst varied coloured foliage draped and beautified the vases. The blooms used were chiefly Japanese in various colours. Mr. N. Davis, of Camberwell, who was placed 2nd, had a somewhat similar arrangement, but with dwarfer stands, and his table was less effectively draped and dressed, still, it was a striking group. Mr. Godfrey, of Exmouth, was 3rd, but his table was lacking in tastefulness.

The next in attractiveness, though losing something by being perhaps too elaborate, was the competition for a table of bouquets, wreaths, sprays, buttonholes, &c. These tables could be faced all ways Here Mr. J. R. Chard, of Brunswick Nursery, Stoke Newington, was 1st, his table having a draping of yellow muslin; at the corners were an anchor, a harp, wreath, and a collar or chaplet; yellow, bronze, and deep chesnut-coloured flowers, being freely used; also fine vases, superbly dressed with flowers and drooping foliage; whilst bouquets, sprays, &c., were plentiful, the whole presenting a combination such as is rarely seen at any show. Without any doubt, both Mr. Jones and Mr. Chard in their respective classes surpassed themselves. Messrs. Perkins & Sons, Coventry, were 2nd, having also a diverse but still beautiful table, one that perhaps only Mr. Chard could have excelled. A looking-glass fixed in the centre of the table, literally framed in flowers, bouquets, and foliage, was an effective feature.

Still in the same category was a class for twenty-four Japanese blooms, set up singly in vases, and on large stems, the whole being in a case of Ferns and foliage. Here D. M. Hayler, gr. to W. Hannaford, Esq., Hendon, was 1st; Mr. Howe, gr. to H. Tate, Esq., Streatham Hill, 2nd; and Mr. W. Davis 3rd. There was much similarity in the setting-up, the better flowers giving the 1st place to Mr. Hayler.

Mr. John Wills, of South Kensington, offered prizes for three vases of Chrysanthemums, each to contain twelve blooms, arranged for effect. Mr. J. R. Chard was the winner of the 1st prize, having tall glass stands set into wire supports, the flowers being dressed with foliage; Mr. F. N. Seale, Sevenoaks, was 2nd.

Mr. D. B. Crane, Highgate, had the best-dressed three epergnes, pleasingly dressed with soft yellow and dark bronzy flowers, and good foliage. Mr. Seale was again 2nd.

Mr. A. Merridew, Camberwell, had the best pair of vases dressed with flowers of Pompon Chrysanthemums; 2nd, Mr. Turk, Highgate.

Mr. W. Howe was a good 1st with one vase of six Japanese flowers, using the beautiful flowers with good effect. In the next vase shown by Mr. L. T. Cook, Holmwood, Hendon, Viviand Morel was the flower employed.

In a similar class for amateurs, the same variety won the 1st prize for Mr. A. Jones, of Hornsey.

Bouquets were numerous, the best pair coming from Mr. Newell, gr. to Mr. E. Saunders, Wimbledon, his flowers being of pink colour in one case, and golden and bronze in the other.

Mr. W. Smith, of Romford, had the best basket of berries and coloured foliage.

Special Classes.

These were for prizes offered chiefly by trade growers for varieties specially sent out by them, but the response was poor, some not even getting an entry. Mr. J. Agate, of Havant, was the only competitor for Mr. H. J. Jones' selected flowers; and for Messrs. Cutbush & Sons' class, Mr. Sandford, gr. to G. W. Wright, Esq., Finchley, was placed 1st. In four other cases there seemed to be no competition.

Fruit and Vegetables.

These were not so plentiful as usual, the Grape classes being the best filled. There were six lots of three bunches of whites, all Muscat of Alexandria, the best really fine bunches coming from Mr. J. Bury, gr. to C. Baver, Esq, Forest Hill; Mr. W. Harman, gr. to the Earl of Denbigh, Lutterworth, was 2nd, with smaller but still handsome bunches; Mr. Simmonds, gr. to W. Cunard, Esq., Orleans House, Twickenham being 3rd.

Black Grapes were represented by nine lots, all but one being Black Alicante. The exception was three large clusters of Gros Guillaume, rough and unfinished. The best Alicantes, not large, but finely finished, came from Mr. Griffin, Combe Bank, Kingston-on-Thames; Mr. J. Bury being 2nd; and Mr. Elliott, gr. to T. H. Graham, Esq., West Molesey, 3rd. Mr. Bury had the finest Gros Colmar Grapes, though not fully coloured. Mr. W. Chuck, gr. to T. Thelluson, Esq., Doncaster, coming 2nd; and Mr. W. J. Empson, gr. to W. Wingfield, Ampthill, Beds, 3rd.

Apples were remarkably scarce, only two half-dozens of dishes being staged in each class. With dessert varieties, Mr. Potter, gr. to Sir Mark Collett, Sevenoaks, was 1st, having very fine Cox's Orange, Ribston, Blenheim, and King of the Pippins, Mother Apple, and Baumann's Red Reinette. Mr. R. Dean, Ealing, was 2nd.

In the cooking class, some fine fruit of Warner's King, Gloria Mundi, Peasgood's Nonsuch, Lane's Prince Albert, Emperor Alexander, and Gascoigne's Scarlet Seedling, came from Mr. Axell, gr. to G. H. Dean, Esq., Sittingbourne, who was 1st; and Mr. R. Dean was 2nd.

The finest six dishes of Pears came from Mr. W. Allan, Gunton Park, Norwich, whose Marie Louise d'Uccle, Durondeau, Doyenné du Comice, Pitmaston Duchess, Emile d'Heyst, and Marie Louise were excellent; Mr. Potter, who was 2nd, had fine Beurrés Baltet and Bachelier; Mr. H. Liney was 3rd.

The show of vegetables was remarkably limited in size; Mr. C. Ross, gr., Welford Park, Newbury, was the only exhibitor of twelve dishes of Potatos, and Mr. C. J. Waite, the Gardens, Glenhurst, Esher, had the best six dishes; Mr. Moss being 2nd.

In the class for nine sorts of vegetables, prizes offered by Messrs. Cannell & Sons, Swanley, Mr. R. Lye, of Sydmonton Court, Newbury, was the only exhibitor, having good samples.

There were four competitors in a corresponding class for prizes offered by Messrs. Sutton & Sons, Reading, Mr. Waite here taking 1st place. Mr. T. Wilkins, gr. to Lady Theodora Guest, Inwood House, Dorset, coming 2nd, Mr. R. Lye 3rd, and Mr. Haines, Coleshill, Wilts, 4th.

MISCELLANEOUS EXHIBITS.

These were, as usual, an important part of the exhibition, for they were responsible in large degree for the display made. Mr. W. J. Godfrey, Exmouth Nurseries, Devon, had a good display of novelties, including some unnamed seedlings of much promise. M. Grayer was a large pink Japanese, and Miss Dorothy Shea, Louise, Sarah Hill, and others, were well exhibited. Messrs. B. S. Williams & Sons, Victoria and Paradise Nurseries, Upper Holloway, London, N., had a miscellaneous collection of plants, including Cannas, Crotons, Ericas, Cyclamens, Cattleyas, Odontoglossums, &c.; and another miscellaneous collection of plants was staged by Messrs. Wm. Cutbush & Sons, Highgate Nurseries, London, N., including a few Orchids, also a small collection of fruit. Mr. H. J. Jones, Ryecroft Nursery, Hither Green, Lewisham, exhibited a collection of new Chrysanthemums; and Chrysanthemum blooms were also shown by Mr. Thos. S. Ware, Hale Farm Nursery, near Tottenham. Messrs. Clibran & Son, Altrincham Nurseries, near Manchester, had cut blooms of Chrysanthemums, including a number of flowers of W. Firkins, a yellow sport from Bouquet de Dame. Mr. W. Young, Holmesdale Nurseries, Stevenage, Herts, had cut blooms of Chrysanthemums; and Mr. A. Merridew, The Gardens, Camberwell House, Camberwell, some plants of Cypripedium insigne in flower, a few Ferns, &c. Mr. James Pike, Acton, W., again exhibited the Carnation Uriah Pike.

The grandest display of all was that put up by Messrs. H. Cannell & Sons, Swanley, Kent, which included a fine lot of Chrysanthemum blooms. John Machar is expected to make a splendid yellow Japanese incurved, and Globe d'Or promises to make a good incurved. Zonal Pelargoniums were also exhibited in quantity and great variety, set up in sprays according to the well-known Swanley system. Mr. W. Wells, Earlswood Nurseries, Redhill, Surrey, had a small group of plants of Chrysanthemums, including Ethel Amsden, the green sport from Viviand Morel.

A good number of Chrysanthemum blooms of new varieties was also staged by Mr. Robert Owen, nurseryman, Maidenhead; Ernest Fierens, a white Japanese, and Owen's Perfection, looked promising varieties.

Messrs. Sutton & Sons, Reading, showed a remarkably attractive collection of Potatos, their fine varieties standing out with marked effect. And Mr. Empson showed some grand samples of Carrots, including Bedfordshire Champion, Sutton's Intermediate, &c.

There was also shown a fine collection of Apples and Pears from Messrs. J. Cheal & Sons, Crawley, a richly-coloured lot of twenty-five dishes. Mère de Ménage Apple, from Mr. C. Holden, Rhyl; and a good collection of Apples and Pears staged by Messrs. Cutbush & Sons, Highgate.

Horticultural sundries were well represented. Mr. Jos. Arnold exhibited a lot of Bedfordshire peat; another stand was devoted to the display of "Pure Ichthemic Guano;" Mr. George, Putney, had another table devoted to the exhibition of his specialties; and Messrs. Iles & Co., Berkshire Pottery Stores, Warner Road, Camberwell, London, S.E., had a collection of artistic garden pottery.

HIGHGATE AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 1, 2.—A capital show was this, the hall in which it was held being crowded to overflowing; the Japanese varieties were very fine, but some of the incurved flowers were wanting a little longer for full development. The special prize offered by W. Reynolds, Esq., for thirty-six blooms distinct, eighteen incurved, and eighteen Japanese, brought out some fine flowers. Here, Mr. J. Burch, gr. to J. Smith, Esq., Mill Hill, gained premier honours, his principal flowers of Japanese being Primrose League, C. Shrimpton, Mrs. C. H. Payne, Princess Victoria, Vivand Morel, and Louise; incurved, Golden Empress of India, Hero of Stoke Newington, Lady Dorothy, Baron Hirsch, Miss Haggas, and John Lambert. A very good 2nd was Mr. E. Rowbottom, gr. to H. R. Williams, Esq., Hornsey, the latter exhibitor taking the chief award in the open class for twenty-four Japanese, extremely fine were G. C. Schwabe, C. Shrimpton, Avalanche, Prefect Robert, Miss A. Hartshorn, Etoile de Lyon, Louise, and Sunflower; 2nd, also a fine lot, Mr. J. Sandford, gr. to G. Wright-Ingle, Esq, Finchley, who gained the chief position for twelve Anemones, fine were blooms of Marguerite, Solleville, Sabin, and Glück; 2nd, Mr. S. J. Cook. A very effective class was that for twelve bunches of cut blooms, set up with Ferns, Grasses, and other foliage. Mr. E. Rowbottom was well to the front here, followed by Mr. Cook, gr. to J. H. Hartridge, Esq, Hendon. In the section open to single-handed gardeners and amateurs for twelve incurved blooms, the 1st prize was well won by Mr. J. L. Turk, gr. to T. Boncy, Esq., Highgate, who had good blooms of Violet Tomlin, Golden Beverley, &c.; 2nd, Mr. G. Amos. Mr. Turk secured the premier place for twelve Japanese, in this stand were good flowers of Mrs. Falconer Jamieson, Amos Perry, and Prefect Roberts; 2nd, Mr. J. Brooks, jun. For six Japanese, Mr. Turk was again well to the front; 2nd, Mr. Kent. The special prize offered by H. R. Williams, Esq., for twelve incurved and twelve Japanese secured some good exhibits. 1st, Mr. J. Brooks, gr. to W. Reynolds, Esq., amongst Japanese were fine flowers of Excelsior, Viviand Morel, Mdlle. Marie Hoste, and Avalanche; incurved, Empress of India, Baron Hirsch, and Madame Darier; 2nd, Mr. J. L. Turk. The same gentleman's prizes for twelve incurved (six varieties) were well contested for, the principal prize-takers being Messrs. J. H. Walker, H. A. Page, and J. Sandford. Mr. J. McKerchar's prize for six Japanese brought out some fine flowers, the prize-takers being Messrs. J. Sandford and J. Brooks. Beautiful were the flowers staged in the class set apart for twelve varieties of Pompons, three blooms of each, Messrs. Turk and Burch taking the chief prizes. In the class for a tastefully-arranged basket of Chrysanthemums, a beautiful exhibit, gaining the first place, was sent by W. D. B. Crane, Archway Road, Highgate; 2nd, W. Matthews. Mr. Crane was also fortunate in securing the chief honours for a dinner-table decoration. In button-hole bouquets, Mr. Eason was the most successful competitor, whilst in epergnes and bouquets the chief prizes were secured by Messrs. Sedgwick and Tubbs. Specimen plants were well shown, Mr. Eason gaining the first place for six trained Pompons, Sœur Melanie, fine. Extremely fine plants gained Mr. Brooks the premier position for six trained specimens of large flowering kinds, Mr. Eason closely following; Mr. Sedgwick sent the best three. The President's prize for a group of Chrysanthemums was won with well-flowered examples by Mr. J. Brooks. In the smaller group the prizes were obtained by Messrs. Sedgwick and Edwards. Fruit was pretty well shown, the prizes for three bunches of Black Grapes going to Messrs. Tubbs, Page, and Brooks; whilst those offered for White Grapes went to Messrs. Walker, Turk, and Tubbs. Apples and Pears were successfully shown by Messrs. A. Page, H. A. Page, Turk, Sandford, Hayler, and Gregory. Tomatos gained the prizes to Messrs. A. Page, H. A. Page, and Brooks. The chief prize-winners in the Vegetable Classes were Messrs. Sedgwick, Tomlin, Bullimore, and Edwards. Amongst non-competitive exhibits may be mentioned a good miscellaneous collection of fruit from Messrs. W. Hunt & Son, Highgate, and plants for the general decoration of the hall from Messrs. W. Cutbush & Son, and Messrs. B. S. Williams & Co. Mr. W. E. Boyce, the Hon. Secretary, deserves much credit for the general arrangements.

THE PEOPLE'S PALACE HORTICULTURAL.
